THE FABULOUS EVINRUDE

DREAMBOAT

Hit of the New York and Chicago boat shows ... powered by two 35 hp Evinnude Larks!

ENTER THE EVINRUDE DREAMBOAT CONTEST—FEB. 21-MARCH 22 Here's a prize to stir your Gypsy blood! A gay and glamorous "houseboat-of-the-future" by noted designer Brooks Stevens. Custom built and luxuriously fitted to accommodate your entire family. Powered to perfection with two famed Evinrude Larks. This answer to your dreams may be as close as your Evinrude dealer. Drop in and pick up a contest entry form.

A visit will reward you in other ways—it's Evinrude Dealer Boat Show time! A wonderful time to see the latest boats on display and the finest motors in 50 years. See these remarkable new Evinrudes with sound-scaled cushioned power... and thermostat temperature control... most efficient boat power yet produced!

Take the family to visit "dreamboat land" at your Evinrude dealer. They'll share the fun—and can help you win!

A Division of Outboard Murine Corporation in Canada | Mid. by Evineude Motors, Peterhorough

EVINRUDE

QUIET OUTBOARD MOTORS

HOW TO ENTER!

1. Go to your nearest Eviprude dealer (look for his name under "Outboard Motors" in the yellow pages).

2. Pick up rules and entry blank,

3. Complete this statement in 50 words or lim: "People who own an Evinrude get more fun out of life. I'd like to own a '59 Evinrude because."

4. Mail official entry blank to "Evincude Contest,"

33 PRIZES... FOUR WEEKLY CONTESTS!

FIRST PRIZE: Fabulous Evinrude "Oreamboat" houseboat...hit of the New York and Chicago Boat Shows...powered by two Evinrude 35 hp Larks.

4 SECOND PRIZES—one each week for 4 weeks: Evinrude V-4 50 hp Starflite motor plus \$1,500 in credit at your dealer for the family boat of your choice and accessories up to that amount. MEXT 26 PRIZES—7 each week for 4 weekt: 3rd Prize: 50 bp Evinrude Four-Fifty motor, 4th Prize: 35 hp Lark; 5th Prize: 35 hp Big Twin; 6th Prize: 18 hp Fastwin; 7th Prize: 10 hp Sportwin; 8th Prize: 5½ hp Fisherman; 9th Prize: 3 hp Lightwin.

SPECIAL BONDS PRIZE: If you buy a 1959 Evinrude motor during the contest period and become a winner—we'll pay you the full value of the motor you bought in addition to the prize.

PS Readers

Cops Are Smart Car Traders

You might like to know that we have received several comments on your article "When Is the Smart Time to Trade in a Car?" [Aug.] which was reprinted in our publication The Notebook.

Although the issue has been out only a few days, it has already caused some reconsideration by car purchasers. Seeing that members get maximum benefit from their dollars is basic credit-union policy and the article seems to be accomplishing this. We appreciate your permission to reprint it.

E. R. BLACKSTONE, Clerk Police Credit Union, San Francisco.

Extras Are Extra on U. S. Cars

When comparing the Lark with the imports [Dec.] you should have defined "without options." A heater, whitewalls, electric windshield wipers and so on are standard on several of the foreign makes you listed, but extra cost on the Lark.

EDWIN W. HUSER, Teaneck, N.J.

What to Do When Your Lights Conk Out

THE little booklets in your magazine are fine and I save mine. Some time back [July, '57] you had one called "What to Do When Your Car Conks Out." Alas, you left out one important problem: what to do if your lights go out. When mine did, I had to drive in the dark!

W. E. TRULL, Auburn, N.Y.

Easy fixes are few. Look for a loose or broken wire and, if necessary, replace the fuse (you should carry spares). Don't cheat around the fuse: If the short that blew the fuse still exists, restoring current could easily start a fire.

Expert Applauds Brake-Fade Article

TALK BACK

I READ with great interest your article "The Baffling Problem of Brake Fade" [Jan.]. You did an excellent job of placing the brake engineers' problems before the reader. I was especially impressed with your comments under the headings "Heat is the Main Problem" and "How Big is a Brake?"

B. B. Brombaugh, Section Engineer Inland Manufacturing Div., Dayton, Ohio.

Semantics in Space

PLEASE don't take this question too seriously. In "The Month in Science" [Dec.] you say that as a space vehicle falls back to earth, "it is at top speed when it hits the dense air, and friction burns it up." When you think of striking a match: Friction doesn't burn it up, it ignites the match. Correct?

FRANK VICTOR, Ph.D., NYC.

Little Cars Rated Low as Snowplows

I TRUST those readers who have been expressing undying love for undersized foreign cars had fun driving through snow and ice this winter. I was quite content with my gas-gulping monster while figuring out how much money I had saved in towing costs.

It was fun plowing through and trying to find the economical foreign babies

that had become buried. The greatest joy of all was sitting in my luxury-loaded Chevy warmly watching shivering owners whose midgets were being towed away.

DONN KING, Rome, N.Y.

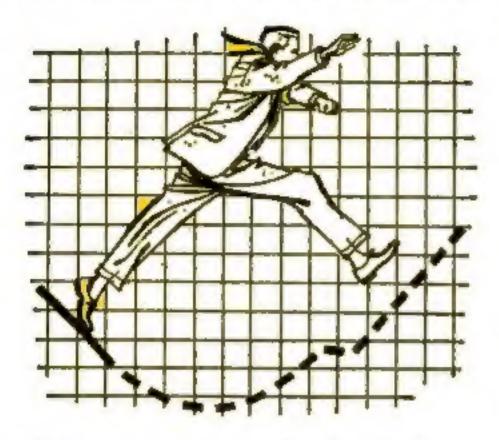

They Won't Sprout from Seed

I am sure some bright lab men could figure out how to make wallboard or other building material from surplus wheat ["PS Readers Talk Back," Jan.].

But I read somewhere recently that In-

HOW TO JUMP THE SLUMP!

Here's a way to cash in on present job trends and avoid the current dip!

While some men are out of work or just hanging on, many others are actually advancing into more responsible, high-pay jobs.

Men on the way up are taking advantage of one known fact: Skills pay off in good times or bad!

Look at the employment picture:

Although more people are employed in the nation than ever before, the latest labor facts show a sharp rise in unemployment among unskilled, untrained workers.

BUT, the SKILLED man's job is the most secure. His odds for holding a job are four times better than the untrained man's. And he's in line for promotion, pay increases, great new job opportunities.

I.C.S. method develops skills fast!

You seldom see an I.C.S. man out of a job. No other school has so many of its former students now in management and supervisory positions.

What I. C.S. is doing for today's successful young men, it can do for you. At home, In your spare time. As rapidly as your time and ability permit.

Find out how! Mark and mail the coupon below. It brings you three valuable books at no cost, no obligation. Three books that can guide you through these critical times, that can help you jump the slump. But act quickly,

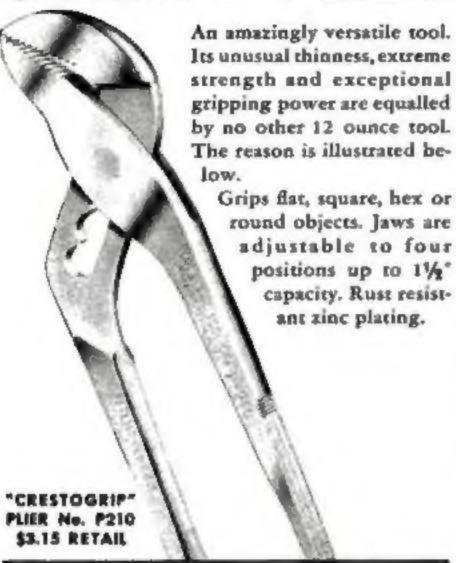

For Real Job Security-Get an I. C. S. Diploma!

dia is getting set to exchange 150,000 tons of manganese and 75,000 tons of ferromanganese for 400,000 tons of U. S. wheat. Seems like we've got all the wall-board we need. But we sure can use strategic metals that can't be dug from the ground here.

JASON KAUFMAN, Chicago.

Dog's Best Friend Heard From

I'm haunted by that woeful, unloved look on the dog under a blanket ["Hints from the Model Garage," Jan.].

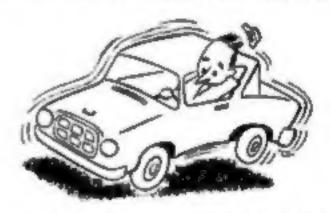

Maybe this is the inside story: The pooch is ashamed and embarrassed for his master who didn't train him in the first place to stay off the car upholstery instead of putting him under that hot, dark old blanket. It shouldn't happen to a dog.

L. D. JOHNSON, Erie, Pa.

Buy a New Car As You Do a Used One?

You say "everybody can get what he wants" this year in cars ["What You Think of the '59s," Jan.]. I hope so.

In '57, I had a '57 Rambler with Flashaway transmission. This worked only when the car was hot. The engine started and ran perfectly, but when you put the selector lever in drive, the car jumped

like a bucking bronco. And how it hated

to go in reverse!

A car is the only thing on sale today that carries no guarantee. I'd advise your readers to take your booklet No. 9, "Checklist for Judging Used Cars," with them when they buy a new car. And check out the automatic transmission in reverse. Another thing: Make the trial run early in the morning—this brings out the worst in the automatic choke.

F. G. DOHERTY, Norwood, Mass.

Rambler, Lark Eights Are Over-Square

In the Devon Francis report ["How Studebaker's New Lark Stacks Up Against Rambler," Dec.], he says that the V-8s in both these cars—like the in-line engines—are under-square. I believe that

LEARN ACCOUNTING

for a BETTER JOB

...MORE MONEY

A SHORT STREAMLINED COURSE TO PREPARE YOU QUICKLY FOR YOUR START IN A SUCCESSFUL ACCOUNTING CAREER!

Free Sample Lesson Will PROVE You Can Master The Training

You need no special talents to be a success in Accounting. You do not even need a preliminary knowledge of bookkeeping. All you need is the will to win-the will to work-and if you apply yourself you, too, can get into the permanent bigger-money class.

Demand for Trained Bookkeepers and Accountants far exceeds the supply-and this demand is increasing every day. A capable accountant should never have any trouble getting a job-and at better than average earnings.

We Guide You Step By Step

Through more than 50 years' experience in training hundreds of thousands of successful accountants, including nearly 5,000 CPA's, we have developed through the LaSalle problem method a practical training in sound accounting principles and practices designed to prepare you rapidly for countless numbers of high paying bookkeeping and account-

ing positions. The success of LaSalle accounting graduates has resulted from their knowledge and application of the principles acquired thru Basic and Practical Accounting, Principles of Accounting and Cost Accounting training. offered in our step-by-step

accounting program.

Federal Income Tax is included to give you the necessary training to qualify for the many opportunities available to bookkeepers

ACCREDITED MEMBER NATIONAL HOME STUDY COUNCIL

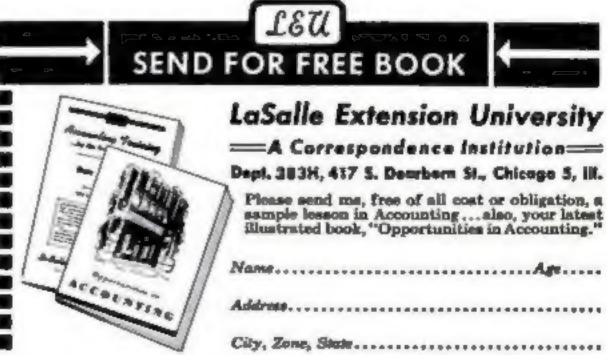

and accountants with this valuable knowledge. Success in mastering the training is assured through the guidance of expert accountants and CPA instructors. You complete the lessons right in your own home, in your spare time, advancing as rapidly as your time and ability

permit.

Send For Sample Lesson And Free Book, "Opportunities In Accounting"

Send the coupon today—our FREE booklet "Opportunities in Accounting" will be sent promptly along with a sample lesson. It explains fully how we train you from the ground upor from where you are now-according to your individual needs.

Get all the facts. The cost is low-terms easy. Don't pass this page without tearing out the coupon and mailing it promptly. It can be the means of your success-more money-a better job. Get our FREE booklets and judge for vourself.

POWERHOUSE

75,000 SQLD AT 4.98

The Pewerhouse is now and excitingly different. Most low east telescopes use 2 tensos—but the new Powerhouse uses 5—yes, 5 synchronized Rothlar lenses—all ground and polished with meliculous care. They are not glued, but anchored is study steel rings. The draw lobes are heavy duty metal. All this means greater power and preater clarity . . . far greater range than you ever drawed possible. And you get no blur, an eloudiness, no distortion, thanks to the 5 tens system that develops a 225 times great magnification.

When first you look through your Powerhouse, you will gase with disbelief at the wanders it reveals. The distant worlds and towns, the people and natural views are rest and the amazing Powerhouse draws them closer! Far closer than a deliuxe 7 x 50 binocular cesting \$250 one ever do. Imagine it—you get a 225 times greater area. You smash thru space barriers. That's why amalour astronomers everywhere are saying! "It's the greatest tele-scape bargain since 1945." That's why it has become the factout suitwhy it has become the factor sulting German telescope in America. Thousands of gravious models sold! Examine the new Powerhouse, try it by pinht or day; enjoy it for the days—without risk or obligation of any kind. Explore the heavens on a clear night. Take in the incomparable beauty of the Milky Way; the unforgettable brilliance of the Ris Disper: the cerie, yet rumgatic the unforgettable brilliance of the Big Disper; the cerie, yet remarkle grandeur of the muon's peaks and crevices; the selemn majesty of lupiter with his 4 tiey muons, in daylight, focus your Powerhouse from the search hillion for superbyiews of nature, villages, people and planes. Whether it he is miles or thousands, your Powerhouse Telescope must bring them in without distortion or milky blar, it must thrill and satisfy you in It must thrill and satisfy you in overy way. Otherwise, rather it after the 18 day period.

both the Lark and the Rambler V-8 engines have a larger bore than stroke and are therefore over-square.

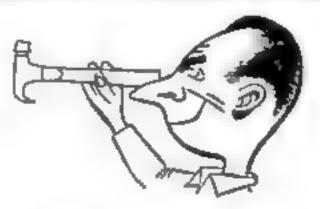

E. M. SMITH, Nutley, N.J.

Right. Bore and stroke are 3.5 x 3.25 inches on the Rambler V-8, 3.56 x 3.25 inches on the Lark V-8.

Case of the Falling Hammer

THE December Know-How File ("Using a Nail Hammer") advises the nail pounder to strike with the center of the face, that is, hammer face and nailhead flush, surface to surface.

But the hammer descends in an arc, so the inside edge of the hammer face strikes

the nail, often bending it. Now if the face of the hammer were slanted inward slightly toward the handle, it would hit the nail square on the head

M. BERGER, Philadelphia.

It is and it does. If you study your own hammer, you'll probably find that the face slants slightly toward the handle.

Chain Is Better

ORDINARY sash chain (No. 8) from the hardware store is more efficient and reliable for fishing electric cable through walls than the string suggested in "Short Cuts and Tips" [Jan.]. Chain always drops straight down, will not break if you jerk it, and is easy to hook.

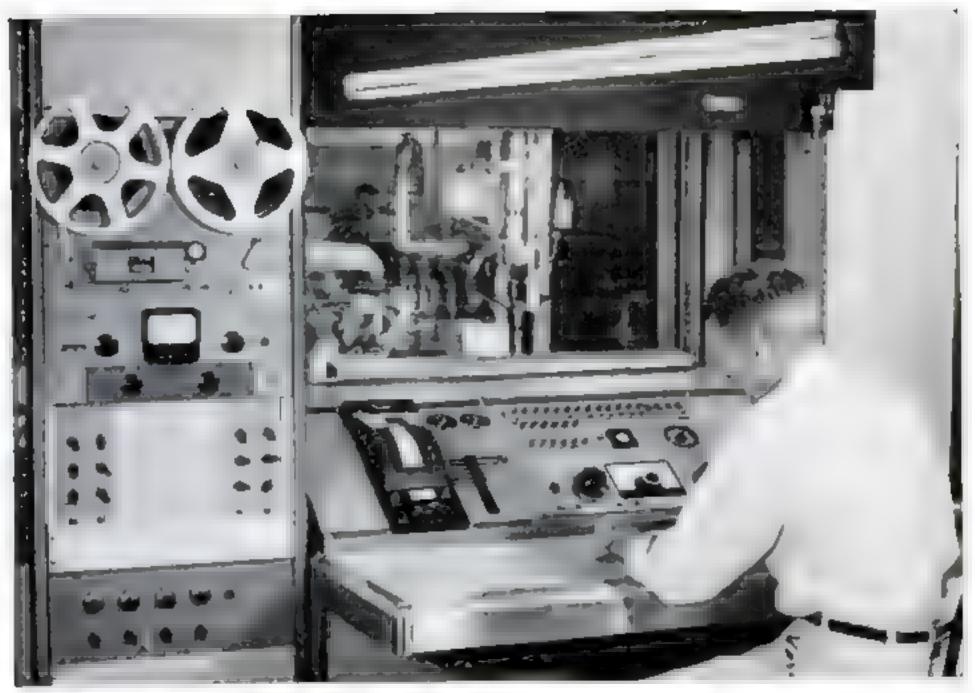

F. H. WAGENER, Red Oak, Iowa.

For more tips on snaking wires, turn to page 155.

is He Right?

You'se wrong by 100 years ["World's Largest Propeller," Nov.]. A prop of the same size—24 feet in diameter—was used in the Great Eastern, launched in 1858.

This was the ship that laid the Atlantic cable. She was 692 feet long, had a beam of 120 feet and a 22,500-ton displacement. Two engines gave out a total of 11,000 hp. One powered the big acrew, the other

NEW PERFECT CIRCLE ROAD TEST SIMULATOR...

another first in power protection for your car!

Remarkable Perfect Circle development tape-records actual road test, electronically duplicates exact engine operation on the test stand!

Perfect Circle's new Road Test Simulator records hours of test driving over all kinds of roads in all kinds of weather and reproduces the test right in the engine test lab...electronically.

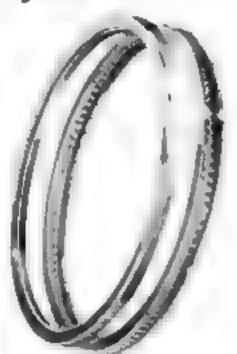

Weeks of testing are accomplished in days to speed engine improvements and give you the very best piaton rings obtainable— Perfect Circles!

Other Perfect Circle firsts include famous PC 2-in-1 Chrome piston

ring sets. Top rings and oil rings are plated with thick, solid chrome. Entire area of ring travel gets complete wear protection, more than doubling life of cylinders, rings, and pistons. No tedious break-in is necessary—rings are pre-seated at factory.

New Perfect Circle Valve Seals stop oil loss through valve guides of overhead valve engines. For best performance, valve or ring jobs should include installiation of Perfect Circle Valve Seals. The cost is surprisingly low.

For full power protection insist on Perfect Circles!

PERFECT

CIRCLE

Den Mills, Ontorio, Canada

turned paddle wheels 58 feet in diameter. This famous vessel carried 6.500 square yards of sail, too.

A. H. MATTHEWS, Lake Beauport, P. Q.

Figures given by the Encyclopaedia Britannica differ, although screw size is not mentioned. The Britannica disagrees on beam (825 feet), displacement (18,-914 tons) and horsepower (3,411 hp. for the paddle engines, 4,886 for the screw engines).

Good Tip from a Smart Girl

I READ my father's POPULAR SCIENCE it helps me with my science in junior high school—and I watch him when he makes something from your magazine.

My father says that if you stop sawing halfway through and wax the saw good, when you start sawing again you think you are using a newly sharpened saw. This seemed to me like a good idea for your magazine and I asked him why he doesn't share it. He says I may if I wish.

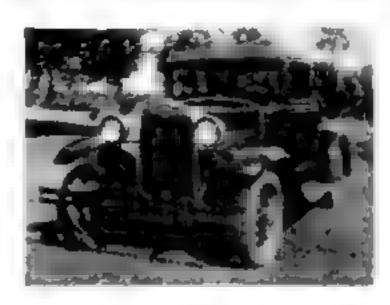

JEANNETTE ROSERTS, Portsmouth, N.H.

They Don't Make Them Anymore

MAYBE some of your young-squirt read-

ers would like to see a real automobile my Ford coupe, purchased new in 1930.

I have driven this car 553,925 miles with the original engine, have used 13

sets of tires, two radiators, two clutches, two universal joints. It has had two engine overhauls—the rear end has never been opened. This car is on the road every day of the year; in fact, I can't drive any other make of car.

W. J. Nicoll, Ocala, Fla.

A GOOD JOB IS EASY TO FIND!

Amazing Home Training Discovery Quickly Gets You into

AIR CONDITIONING

Where 20,000 Newly-Trained Mechanics Are Needed Yearly

B. C. ANDERSON, Provident

It's hard to believe, but true! A good job is easy to find. Over 20,000 new mechanics are needed each year in the fast-growing Air Conditioning and Refrigeration field! Here's why: 150 million units are in use today. Each year, 3 million refrigerators, 2 million air conditioners and 1 million freezers are sold. All these units need periodic service and repair.

But you've got to have skill to land a highpay, steady-work mechanic's job. Acquire the necessary skill by training at home in space time, Learn more about CTI home training: Mail coupon for fact-filled free booklets.

CTI Shows You How to Make Money as You Train CTI training is practical, much like field calls. Most students do part-time work soon after enrolling. Some get jobs with dealers, others make calls on their own. A number sign service contracts with food stores, meat markets, motels, restaurants. With earnings, students pay tustion, buy shop equipment.

Be Independent! Open a Shop and Be the Boss

Many students make service calls, build up customer lists. Others get evening and week-end jobs. Upon graduation, a surprising number prefer to go in business for themselves.

CTI training and CTI tools can give you a start. Service shops often blossom into sales rooms.

Auto Air Conditioning is New Opportunity Field

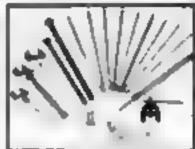

Hundrech of thousands of new cars are being equipped with air conditioners. Auto dealers are advertising for skilled refrigeration mechanics, offering premium pay, to set up service departments. Or, you can go in business for yourself, and contract with auto agencies to do this

type of installation and repetr. You can make hig profits either way. Mail coupon for free facts.

This is the home of CTI, one of the world's great home study schools. Through this Institute you receive "training you can trust". Over 40,000 carrest graduates from count to court.

COMMERCIAL TRADES INSTITUTE
1400 Greene Avenue * Chicago 26, Hinele

COMME

1400 GREENLE

Another CTI "first"! You learn by practicing because CTI sends you 25 training kits. You get real experience, because you complete 23 "on-the-job" projects. You do 10 service and trouble-shooting "jobs"! You get all parts and tools to build a heavy-duty, commercial-type. "4 h.p. condensing unit (above). Note photos of two of the 25 kits (left) One shows special service tools; the other includes motor, fan, pulley, more tools. Kit training helps you perfect skill, get field-type experience, learn faster It's fun to learn this way.

Get Valuable Experience!

You Learn by Practicing—

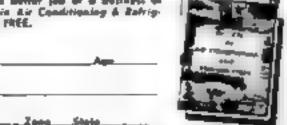

A mechanic in the Air Conditioning and Retrigeration field takes home big pay. He works steady all year 'round-with lots of overtime, if he wants it Be a mechanic!

Right Tool for the Job

THE writer of "Soldering Guns Do Dozens of Extra Jobs" [Dec.] should try to

soften putty with one of these guns. He has a revelation coming to him

When he has stabbed away and given it up as a bad job, tell him to try an electric putty softener.

I bought a soldering gun specifically for removing putty and was disappointed. But I

J. R. HARMAN, Grand Rapids.

The Backward Model T

CERTAINLY reversing an old Model T on a hill would feed more gas through the gravity feed system ["PS Readers Talk Back," Dec.]. But there is another reason why old-timers frequently backed up a steep grade. The Model T had a lower gear reduction in reverse.

The reduction with standard gears was 9 98:1 in low; 14.52:1 in reverse. Actually, the gain in reverse was not quite so great because of loss due to friction, but there was still a definite gain.

LEO H. SIMONS, Herrick, S.D.

. . . I wonder if Gus Wilson's memory is as good as mine? I remember seeing many a Model T with a tire valve fitted to the tank cap. When the front end got above the gas level in the tank, the doughty driver whipped out the tire pump. Two or three strokes with this and he was on his way. Of course the tank had to be vented so the gas would feed once the lizzie was rolling again.

C. J. McQueen, Milwaukie, Ore.

BIGGEST OPPORTUHITY FIELDS OF THE CENTURY!

The month in science

Earthquakes in Idaho? Yep. And bad ones. California bears the shaky reputation (because 90 percent of the nation's small quakes occur there) but serious tremors are just as likely over much of the rest of the country.

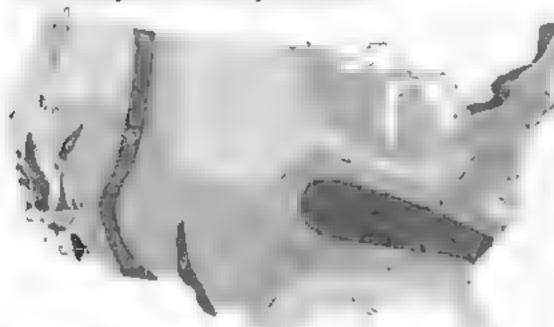

> Caltech expert Charles F. Richter, plotting earthquake risks across the U. S., found that only the Gulf Coast, the Northern Pacific area, the North Central states and a section straddling Virginia and North Carolina are generally safe.

> Dr. Richter rated areas by the intensity of the worst shaking to be expected over a long period of years. This "Modified Mercalli" scale goes like this:

- Intensity VI—slight damage to weak buildings.
- Intensity VII—considerable damage to weak buildings.
- ► Intensity VIII—slight damage to sturdy buildings.
- Intensity IX—considerable damage to sturdy buildings. (Intensities less than VI cause no damage; over IX are rare.)

Trouble is, earthquake risk changes sharply from point to point within an area. It depends on the ground structure. Earthquakes

Will earthquakes shake your home?

Darkness of shading Indicates expected severity of earthquakes start from a fault. a big break in the earth's rock formation. When one side of the fault shifts in relation to the other. the ground shakes, sometimes many miles away. Loose sandy ground shakes much harder than solid granite. That's what makes the difference.

Take New York City, for instance. It is in the range of two separate faults. Some

sand-dune areas on Long Island are rated IX: Even sturdy buildings there would probably suffer considerable damage. But Manhattan Island-granite-rates only VII and possibly even VI.

Dr. Richter listed some of the nation's major cities as quakey: Boston, Buffalo, Washington, Chicago, Kansas City, Tulsa, Seattle, Portland and San Diego can expect moderate Intensity VIII shaking, enough to damage sturdy buildings. The downtown business and industrial centers—usually set on low, soft ground-are the riskiest; residential areas in the surrounding hills are generally safer.

Main purpose of Dr. Richter's classification is to guide local

The month in science

officials in framing building codes and insurance men in setting rates. The big trouble, he says, is the large number of weak and dilapidated buildings. They are too flussy to be safe under ordinary use, and just fall apart when a small quake hits.

Pupples, go 'way. You may be able to outwit the pet dog (female) who embarrasses you with the prospect of a litter of indeterminate breed: Give her a hefty shot of malucidin when you notice her interesting condition. The unborn pupples will disappear.

Dr. Leon F. Whitney of Yale Medical School found that malucidun reverses pregnancy in dogs. Literally reverses, too: The embryos are absorbed into the mother's bloodstream. In tests on beagles and coonhounds, the drug worked every time, even when administered only three weeks before the expected birth.

Would it work on humans? Dr. Whitney got good results with mice, but not with rats or rabbits. All he will say is: "Malucidin should be a boon in the elimination of unwanted puppies."

Germ warfare—against bugs. You may keep insects out of your garden by infecting them with bacteria and making them so sick they curl up and die. That's the idea behind a new insecticide.

It consists of spores—germs in the tough, dormant form that is ready to grow fast when conditions are right—of microbes called Bacillus thuringiensis. Thuringiensis is death on mothlike insects that munch cabbage, tomatoes and corn. It does not sicken bees, animals or fish. People have eaten the stuff without harm.

Another new bug killer does house pests in by drying them into mummies. It is an extremely fine silica powder—individual particles about .00004 inch across—that attacks the wax covering insect bodies. Tests show it to be very effective against roaches and termites, promising for flies, mosquitoes and ants.

Big hope for the dry-'em-out-and-kill-'em insecticide is that the bugs will not develop resistance to it. Insects possess remarkable ability to adapt: New breeds of bugs quickly evolve with body chemistry rejiggered to shrug off old poisons. The new insecticide gets around this because its action is physical, not chemical, and external, not internal.

Both these bug killers are still experimental, and are not yet on sale. The germ dust is called Thuricide (Stauffer Chemical Co., NYC); the sdica powder is Dri-Die (W. R. Grace & Co., NYC).

Supersonic whips. Physicists, who several years ago got into a high-level mathematical bassle trying to explain the queer motion of a round-bottomed toy top, last year worked themselves up over bullwhips (also leather belts and wet towels). Reason: The characteristic crack of a snapping whip sounded suspiciously like a sonic boom—as though the tip had smashed the sound barrier to travel faster than sound.

They never did settle the top argument completely. However, a report in the Journal of the Acoustical Society says that the tip of a whip gets up to 950 m.p.h., well beyond the speed of sound. The snap is shock waves generated by the supersonic tip.

KNOWLEDGE
THAT HAS
ENDURED WITH THE
PYRAMIDS

A SECRET METHOD FOR THE MASTERY OF LIFE

HENCE came the knowledge that built the Pyramids and the mighty Temples of the Pharaohs? Civilization began in the Nile Valley centuries ago. Where did its first builders acquire their astounding wisdom that started man on his upward climb? Beginning with naught they overcame nature's forces and gave the world its first sciences and arts. Did their knowledge come from a race now submerged beneath the sea, or were they touched with Infinite inspiration? From what concealed source came the wisdom that produced such characters as Amenhotep IV, Leonardo da Vinci, Isaac Newton, and a host of others?

Today it is known that they discovered and learned to interpret certain Secret Methods for the development of their inner power of mind. They learned to command the inner forces within their own beings, and to master life. This secret art of living has been preserved and handed down throughout the ages. Today it is extended to those who dare to use its profound principles to meet and solve the problems of life in these complex times.

This Sealed Book-FREE

Has life brought you that personal satisfaction, the sense of achievement and happiness that you desire? If not, it is your duty to yourself to learn about this rational method of applying natural laws for the mastery of life. To the thoughtful person it is obvious that everyone cannot be entrusted with an intimate knowledge of the mysteries of life, for everyone is not capable of properly using it. But if you are one of those possessed of a true desire to forge ahead and wish to make use of the subtle influences of life, the Rosicrucians (not a religious organization) will send you A Sealed Book of explanation without obligation. This Sealed Book tells how you, in the privacy of your own home, without interference with your personal affairs or manner of living, may receive these secret teachings. Not weird or strange practices, but a rational application of the basic laws of life. To obtain your complimentary copy use the coupon opposite of address Scribe. E.C.L.

Have you heard...?

Waiting at the end of the road. Harvard Medical School has devised a five-year plan to study car fatalities. Not just another lab stress-and-strain setup, this one's a "cradle to grave" project aimed at finding out what made the driver tick (or stopped his ticking). A 14-member team of psychiatrists, engineers, lawyers, physicians, mechanics—even a priest—will survey accidents as they happen.

Alerted by two-way police radio, four of the team will converge at the scene of an accident. An automotive engineer will check mechanical factors; a traffic engineer will note the flow pattern, speed limits, etc.; a 'human' engineer will study the car's size and structure in relation to the driver; a doctor will determine the driver's physical condition. Special autopsies will be arranged if necessary.

Social workers and psychiatrists will follow up with interviews of witnesses and next-of-kin, while lawyers and priests will pender the legal, moral and ethical aspects. To qualify for an \$810,000 Federal grant, Harvard worked up a number of test cases: Four of the so-called accidents turned out to be suicides; one, a possible homicide.

Revolution in appliances? Brighter and shinter than ever, the '59 appliance lines have appeared onstage. But appliance men are looking past the chrome lids to two developments, still in the wings, that threaten to steal the show—and may well end up revolutionizing the industry. Both are by Westinghouse:

- An ultrasonic sink. It uses high-frequency sound to clean pots and dishes.
- An electronic refrigerator. This is the "no moving parts" idea based on the "Peltier effect" of semiconductors [PS, Oct.].

They've applied the same principle to a cupboard dehumidifier as well. No more soggy snacks.

Most other '59 appliances stress looks and convenience. A few offer some functional improvements:

- ► Frigidaire's frostproofing system eliminates snow on frozen foods. Air loaded with heat and moisture from inside the refrigerator and freezer passes outside to the cooling coils. There moisture is evaporated by a condenser coil.
- ► GE's four-cycle-control dishwasher adjusts for delicate crystalware as well as heavy-duty crockery.
- ► GE has a Carboloy cutter in its Disposall. The waste cutter, says GE, is "almost as hard as a diamond."

For sheer convenience: There's an oven that pulls out and sheds its top for easy cleaning (Frigidaire) . . . another, with a temperature-control guard, that cooks meat to the desired doncness, then cools the oven to match and hold the meat's temperature (Westinghouse) . . . Look for the "programing" principle in more and more beavy appliances. In washers and dryers it means

INVENTORS

Learn how to protect your invention. The U.S. Patent Laws provide that any new and useful art, machine, article of manufacture, or composition of matter, or any new and useful improvement thereof, may be patented if the act of invention is involved. Therefore, every inventor with a valuable invention should take advantage of the Patent Laws and proceed for patent protection in order to safeguard his rights.

A patent gives the inventor the exclusive right to prevent others from making, using, or selling the invention claimed in the patent for a period of seventeen years.

The Patent Laws were enacted for the benefit of the inventor to give him protection for the features of his invention which are patentable. These features must be properly and concisely set forth and claimed in a formal application for patent, in order to comply with the requirements of the Patent Laws. For that reason, unless the inventor is familiar with patent matters, he should engage a competent registered patent attorney or agent to represent him. We are registered to practice before the U.S. Patent Office and are prepared to serve you in the handling of your patent matters.

A specially prepared booklet entitled "Patent Guide for the Inventor", containing detailed information with respect to patent protection and procedure, together with a "Record of Invention" form will be promptly forwarded to you without obligation upon request.

CLARENCE A. O'BRIEN & HARVEY JACOBSON

Registered Patent Attorneys

Have you heard...?

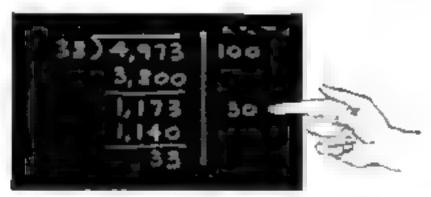

dialable water-time-spin-dry combinations to suit any load . . . For people who have just about everything else, there are shelves that swivel out or operate by pushbutton (GE), or tilt down (Westinghouse).

Has Junior's math looked weirder than usual lately? The reason: There's a new method of long division rampant, "Division by Estimation." It has at least two points in its favor: It's simpler, and it eliminates some of the old artificiality. Here's how it works:

Suppose you're dividing 38)4,973. Instead of saying, "How many times does 38 go into 49?" you estimate the whole answer: h.m. times does 38 go into 4,973—and, making life easy for yourself, you figure "at least 100"... So, to the right of the problem write "100," and underneath the 4,973 write the product 3,800 and proceed to subtract in the usual way:

You have now pared down the problem to a simpler one: How many times does 38 go into 1,173. Again you estimate. This time try 30 (the game being to pick numbers that are easy multipliers—with 0's for example). Repeat the process and check the result.

Ah-ha... the remainder now is less than the divisor—so you're through. Add up your estimates: 100+30-130, tack on your remainder (33/38), and there's your answer: 130 33/38. If your early estimates were too low, you just take a few more steps; if they're too high, you have to try again. Eventually you'll come out with the right answer. And the bright kids get to be pretty tricky guessers.

Man's latest space key: Brutus, the monkey. Known to his associates as "Brutus the Bored," the 12-year-old rhesus sits in his testing box day in and day out surveying a panel of flashing lights. In less than a month's time he's learned to make the appropriate sequence of key pressings to avoid a mild shock and to gain his piece of sugar. Purpose of the test is to train him for rocket travel. If he fails to respond to such sensory stimuli out in space, scientists might deduce that his hearing or sight had been impaired.

INVENTORS

If you believe that you have an invention, you should find out how to protect it. The first step is to have a search made of the prior pertinent U. S. patents. If a report on this search indicates that the invention appears patentable you can apply for a patent, and the specifications and claims should be prepared.

The firm of McMorrow, Berman & Davidson, with offices in Washington, D. C., is qualified to take the necessary steps for you. We can make a preliminary search on your invention, advise you whether we think it can be patented, and prepare your application for patent.

Unless you are fully familiar with the U. S. Patent Laws, we recommend that you engage the services of a Registered Patent Attorney to protect your interests. The patent laws are your laws. A patent gives you the right to prevent others from making, using or selling the invention claimed in your patent for a period of 17 years.

Use these patent laws for your protection. Investigate whether your invention can be patented. If you have what you believe to be an invention, we suggest that you have this firm make a search for you.

Send for a copy of our Patent Booklet entitled "How To Protect Your Invention," containing information about patent protection and patent procedure. Along with this we will also send you an "Invention Record" form, for your use in writing down and sketching details of your invention. We will mail them promptly. No obligation. They are yours for the asking.

Air house shields construction

WHEN bad weather halted work on Ford's new transmission plant at Sharonville, Ohio, the job was done under a 40by-100-foot air-supported plastic dome. Above, a section near completion.

Fire escape gets modern touch

Thus artistic semidetached fire escape serves for emergency exit from a new exhibition hall in Dusseldorf, West Germany It is the building's only fixed stairway; all those on the inside are escalators.

Address

Do the job better because power attachments are driven direct from the engine by splined steel shafts and gears. No belts or chains to slip, wear or break. More power at the working tool!

A FREE demonstration by your local sales and service representative will show you, beyond doubt, that the Gravely and its attachments will do your jobs better, faster, easier. Compare You will see that you get more power, more performance, more for your money! . . . Available on installment plan.

Big, 24-page illustrated booklet, "Power vs Drudgery", shows how the Gravely solves your lawn and garden problems...
Write for it today!

FREE! MAIL NOW

Power attachments securely mounted by only four toles. Balance, casy handling, simple controls Cutaway view shows Gravely a clean compact, power engineered design—the reason for its remarkable performance. Make the wise choice—choose Gravely!

My name is Charles Atlas. I can't promise you'll win the title of "World's Most Perfectly Developed Man" as I did. But I do believe I can make a powerful He-Man out of you -in a very short time. In fact, you can prove it to yourself -- at my risk. During the last 30 years I've turned thousands of weaklings into human dynamos of strength and endurance. My big free book tells how my secret of "Dynamic Tension" may be able to do such a job for you. No cost or obligation. Where shall I send your copy?

Mail coupon now for FREE 32-page book. Tells how I can give you 'Stand-Out' muscles—how 'Dynam-ic Tension' can make you a new man -confident popular successful See actual photos of men who became Atlas Champions" Read answers to

Inventors

If you consider your invention valuable, take these necessary preliminary steps promptly to protect it by applying for a United States patent.

Sketch and describe your invention. (For convenience in starting action on your invention, use "Evidence of Invention" form offered below.)

Sign, date and have this invention disclosure witnessed by two people capable of understanding your invention.

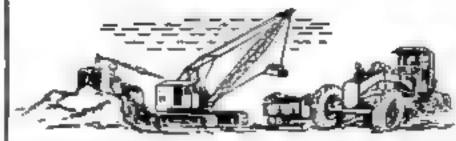

Have us make a preliminary search among U. S. patents already granted for similar types of invention. We then prepare a report for you on the probable patentability of your invention and recommend your further course of action.

This firm is registered to practice before the U. S. Patent Office. We are available to assist you in the preparation and prosecution of your application for patent.

We shall be glad to send you promptly and without obligation, an instructive booklet—"Patent Protection for Inventors"—and our convenient "Evidence of Invention" form.

FALSE TEETH

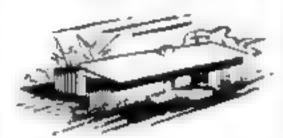

That Loosen **Need Not Embarrass**

Many weavers of false teeth have suffered real embarrassment because their plate dropped, slipped or webbled at just the wrong time. Do not live in fear of this happening to you, Just sprinkle a little FASTEETH, the alkaliae (non-acid) powder, on your plates. Holds faise teeth more firmly, so they feel more comfortable. Does not sour, Checks "plate odor" tdenture breath). Get FASTEETH at drug counters everywhere,

CHOOSE YOUR FUTURE!

Here's YOUR chance to start a money-making, year round business of your own and make the success you've dreamed about.

G. R. Adcock took in \$102 in one day. O. W. Hare landed a \$750 botel job. J. S. Corbit grossed \$279.50 hus first month. Homes, hotels, offices, clubs, offer you big profit possibilities. Auto upholstering also.

NO SHOP OR OFFICE NECESSARY . You clean furniture on customers' premises. No hauling, no high rents. Supplies inexpensive; you operate from your own home. What you take in is mostly profit.

If you want to be your own boss—free from lay-offs and strikes, we will help you to start and succeed.

This is not a lease proposition. You own the machine, you work when and where you please and all the money you take in is your own.

VON SCHRADER MFG. CO.----317 "D" Pl., Racing, Wisconsin

Shrinks Hemorrhoids New Way Without Surgery Stops Itch — Relieves Pain

For the first time science has found a new healing substance with the astonishing ability to shrink hemorrhoids and to relieve pain—without surgery.

In case after case, while gently relieving pain, 'actual reduction (shrinkage) took place.

Most amazing of all—results were so thorough that sufferers made astonishing statements like "Piles have ceased to be a problem!"

The secret is a new healing substance (Bio-Dyne*)-discovery of a world-famous research institute.

This substance is now available in sup-pository or cintment form under the name Preparation H. Ask for it at all drug countersmoney back guarantee. *Reg. U.S. Pat. Off

How to Make Your Own

Built-Ins and Space Savers

Here, at last, is the book that shows you how to expand your home by transforming unused space into compact, attractive living areas. Bill Baker, nationally known designer and furniture maker, brings you his original designs for 15 complete, space-saving projects. Step-by-step photos, hundreds of easyto-follow instructions, exploded views and diagrams make every project easy to build.

Shows you how to cut costs with inexpensive plywoods, how to finish them with modern wood trims, laminates, plastics. You'll learn cabinet makers' secrets, acquire knowhow about a wealth of techniques for indirect lighting, panelling, and much, much more?

HELP US KEEP THE THINGS WORTH KEEPING

If you're a father, you don't have to look into your briefcase for the facts on how much peace is worth to you.

The answer is right in your heart.

But keeping the peace isn't just a matter of wanting it. Peace costs money. Money for strength to keep the peace. Money for science and education to help make peace lasting. And money saved by individuals to keep our economy healthy.

Every U.S. Savings Bond you buy is a direct investment in America's Peace Power. It not only earns money for you—it earns peace. And it helps us keep the things worth keeping

Areyou buying asmany Bonds as you might?

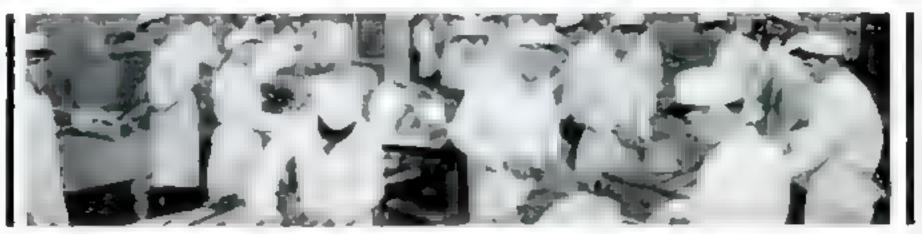

Photograph by Harold Halma

Glossary of Space Talk

ARE you embarrassed when the talk gets around to apogee and perigee, ionosphere and troposphere? No need. This one-page glossary of space talk will help you toss off "magnetohydrodynamics" as glibly as a native of Cape Canaveral. It's adapted from a longer list in Republic Aviation's booklet "Space Talk." Don't worry about pronunciation; nobody will know if you're wrong.

Abort (as in "aborted flight"). The failure of a rocket to function properly.

Alcohol. Not the 90-proof stuff but ethyl or methyl alchohol, which is used with liquid oxygen as a propellant.

Apogee. The point farthest from earth in the orbit of a missile or satellite.

Asteroids. Numerous small planets revolving around the sun, now joined by a Russian-built fellow traveler

Auntie. Nothing female, but slanguage for "antimissile missile."

Backup. A substitute rocket, to save time in the event of a failure.

Bird. Inanimate objects that fly: missiles, satellites, etc.

Blow-down tunnel. A wind tunnel that operates by releasing gas from a tank.

Capsule. A fancy term for the cockpit in high-speed aircraft and space ships.

Decay. Space talk meaning loss of energy, when referring to an orbiting satellite.

Dog house. The mound-like housing for instruments outside a rocket.

Destruct. The deliberate exploding of a missile after it has been launched.

Exotic fuel. A fuel with a high energy content.

Free radical. An atom or group of atoms broken away from a stable compound by application of external energy.

Gantry. Special crane or scaffold used in missile launchings.

Grain. Body of a solid propellant used in a rocket. It is shaped to burn without surges.

Hardware. Pieces of finished equipment for a space ship—air frame, motor parts, instruments.

Hydrasone. One of the exotic fuels.

Hydrocarbon fuel. Fancy term for gasoline or kerosene.

72 POPULAR SCIENCE

lonosphere. The outer region of the atmosphere beginning about 25 to 50 miles above the ground, depending on the theory you prefer.

Ion engine. A space-ship engine in which the thrust is obtained from a stream of ionized atomic particles.

Kill. Destroying a missile or enemy aircraft.

Launch pad. The steel-and-concrete base from which a missile is launched.

Light year. Some 6,000 billion miles (the distance light can travel in one year's time).

Lox. Nothing nutritional—short for liquid oxygen. Explosive.

Magnetohydrodynamics. A tongue-twisting combination of several existing words to describe the study of the interaction between magnetic fields and electrically conducting fluids and gases.

Moon suit. Inflatable coveralls worn for high-altitude flights and space tests.

Nossie block. The throat of a wind tunnel, which regulates air flow and velocity.

Oxidizer. A substance, generally lox, that combines with a fuel to produce heat and gas.

Perigee. The point closest to earth in the orbit of a satellite.

Photon engine. A rocket engine that gets thrust from a stream of light rays.

Pick-up. Not what you think, sir! It's a sensing unit that picks up and measures temperature, pressure, velocity, etc.

Re-entry. Whenever a space craft comes back into the earth's atmosphere, it is "re-entering."

Relaxation time. Not a planetary coffee break, but the period of time necessary for material to return to normal state following stress or temperature change.

Satelloid. Half airplane, half satellite, designed to orbit, then return to earth

STOL. Short for Short Take-Off and Landing

Troposphere. The lower area of the earth's atmosphere.

Umbilical cord. The servicing fluid or electrical lines connecting a rocket with the ground units. It is quickly detached at launching time.

Zip fuel. Special high-energy jet fuel.

There's An Elmer's Glue for Every Job You Do!

ELMER'S .

GLUE CHART

Gluing Jobs

Special Requirements

The Give To Use

For general interior gluing: wood, paper, pottery, cloth or other porous materials. Light wood assembly (joining, laminating, veneering, dowelling), novelties, toys, models, school projects and all types of repairs.

Good, transparent bond with speed and convenience. No mess, non-staining. Ready to use—no mixing. ELMER'S GLUE-ALL

The modern plastic glue in the handy squeeze bottle!

For gluing plastic laminates to wood without clamps . . . Formica, Micarta, Textolite, Parkwood, Consoweld, etc. to counter tops,

tables, desks, kitchen cabiriets, etc. For thin gauge metal or foil to wood. Also, leather, linoleum, synthetic rubber to other porous or non-porous surfaces. Good bond not requiring heat or excessive pressure. Highly resistant to heat or moisture. Fireproof, nontoxic, easy to use. ELMER'S CONTACT CEMENT

Water based — non-flammable. Washes off hands and equipment with warm, soapy water.

For wood gluing where a waterproof bond is required ... boats, outdoor furniture, sports equipment, window boxes and all types of outdoor gluing.

Maximum strength bond, completely waterproof with resistance to mold, fungus, noids, alkalis, solvents, boiling water, moist and dry heat. Lasting durability, excellent gap-filting qualities.

ELMER'S WATERPROOF GLUE

Forms bond stronger than the wood itself!

For stainfree gluing of acid woods like oak, mahogany, etc. For furniture panels, cabinet-work, veneering ... any job where a clean glue line is important.

Good, long-lasting, heat and water resistant bond. Easy to work with. Good gap-filling qualities. For use with clamps in a working temperature above 75°F.

ELMER'S PLASTIC RESIN GLUE

Powdered Urea Resin Glue. Mixes easily in cold water.

For wood gluing where a reliable, economical glue is required for outdoor gluing in low temperature. For heavy-duty wood work like laminating beams, gluing sashes and doors, counter tops, tables, etc.

Good water resistant bond. Easy to work with, regardless of temperature. Good gap-filling qualities. Inexpensive by comparison with many other glues. Should be used with clamps. ELMER'S CASEIN BLUE

Powdered casein. Easy to mix with cold water

Borden's Products FOR THE HOME HANDYMAN

For technical information on special adhesives or free Gloing Guide write The Borden Company, Dept. N-3, 350 Modison Avenue, New York 17, New York. There is no one glue that will do all jobs well, but with these five great Elmer glues, most home, farm, shop and school jobs can be done correctly. Tear out and keep this chart as a handy reference.

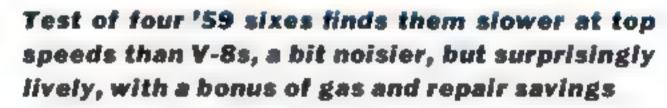

Get the honest taste of a LUCKY STRIKE

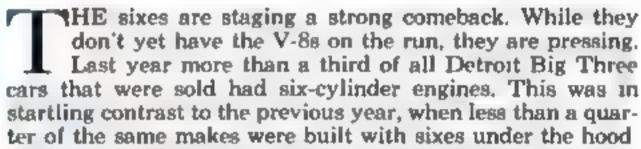

What You Save by Driving a

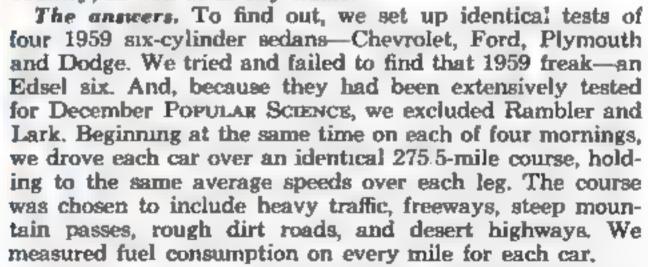

It's no secret that fleet operators buy sixes by the thousands. Or that many police departments use them for city patrol work. Or that taxi operators like them for their better fuel mileage in traffic. Should the rest of us go by fleet experience in buying personal cars? How good is a modern six in everyday driving—on the expressway and in the

country, as well as in city traffic?

The sixes as a group. What's it like to wheel 3,500 pounds

PLYMOUTH

DODGE

A new six gives you two to five more miles per gallon . . .

Test cars were gassed from the same pump, filled to a mark in the filler neck.

Each var carried a calibrated mileage meter, cut into the fuel line. Every drop of gas was measured and controlled. At right, a mileage meter hangs from the door glass, It can measure the exact distance traveled on a tenth of a gallon of gas.

of car behind an economy engine? Surprisingly good—and it might seem even better if you didn't know there was a six under the hood. (Passengers who weren't told had no idea the cars were sixes.) But I did notice that all the cars were noisier than their V-8 opposite numbers. You soon get used to the extra engine noise in traffic; in the country you remain aware of it.

Highway performance, in general, is satisfactory for normal driving. But as for high speeds, the sixes simply don't have it. They seem to peak out around 85 m.p.h. true, whereas their more muscular brothers readily top 100 m.p.h. It's probably more important that at 45 m.p.h., there's only about 10 percent difference in horsepower and torque between comparable sixes and eights. But it is also true that, in the ranges above 70 m.p.h., the six-cylinder jobs have little to spare.

Now for the specifics.

Chevrolet. The best gasoline mileage of the four cars I drove was racked up by the Chevy six. This was true at all speeds and traffic conditions. The engine started quickly and idled easily, and its three-speed manual transmission had the right ratios to stay with traffic. I didn't win any green-light races, but neither did I hold anybody up. Ride and handling were satisfactory, though there was considerable lean on hard turns. It's hill climbing was good, though not quite up to Plymouth's. The car had the typical GM feeling of solidity, even when bombed along washboard dirt roads.

Ford. This sedan had the best-finished interior of the four we drove. But it had its drawbacks, too. Whether warm or cold, the engine was slow to start. And while there was power enough, the engine seemed to labor at anything below 20 m.p.h. in high. I found the shift linkage stiff and awkward at first.

On open highways the Ford would move briskly enough, but it seemed a little light on passing punch when oncoming cars claimed their share of the road. Handling on good roads was fine, with neither wind-wander nor the need for constant correction, but it fell off somewhat on rough sur-

76 POPULAR SCIENCE

It's easier to work on and cheaper to keep in new parts

faces. Neither hill climbing nor fuel economy were strong points of this particular car. Up miles-long Cajon Pass, its maximum speed was 60 m.p.h., and it was drinking gas at the rate of 10 miles to the gallon in the climb. Our other

sixes went up the same grade faster on

less fuel.

Plymouth. This six felt good in traffic, because the engine showed enough lowspeed torque to lessen the need for frequent shifting. Though I trimmed no V-8s that were really trying, the Plymouth six showed enough pep to stay right along with a fast-moving crowd. In the country I found that road handling was the best of the four cars, good on both smooth or rough surfaces. Hill climbing was also the best of the four. About all that I found to criticize was the fact that the front-end sheet metal didn't seem well braced; it weaved more than that on Ford and Chevy during fast travel on bumpy roads.

Dodge. This was the only six driven that was paired with an automatic transmission. It didn't make a happy combination. Even though the car had better sound insulation than its low-priced brothers, the engine wound up noisily when you opened the throttle in traffic. It seemed to me that it was overgeared, or that the shift points were set too low. Highway travel was pleasant and both curves and rough roads were taken in style. But hill climbing was not a strong point; in the mountains the gear-box would downshift and upshift constantly in an effort to keep you going at a reasonable speed. On the 32-percent grade the car was extremely slow, and my two passengers

seemed at least one too many.

Comparing the engines. Some interesting comparisons can be drawn from the engines of these sixes. Chevy gets 135 hp at 4,000 r.p.m. from its ancient but frequently reworked overhead-valve engine. Plymouth and Dodge get 132 hp. at 3,600 from the old flat-head six that they've run for years. Ford and Edsel claim 145 at 4,000 from a newer but by no means brand-new OHV job. The torque figures don't vary appreciably among the four engines.

What is important, perhaps, is that the overheads don't put out peak torque until they are turning at the equivalent of roughly 50 m.p.h. The flat-head in Plymouth, however, peaks in torque down near 30 m.p.h.—which accounts for the lesser shifting in traffic. One compensatory drawback—though not a serious one—is that piston travel per mile is a bit greater in the long-stroke flat-head engine.

If you shop by the pound, it may surprise you to learn

Cresting a 32-percent grade, the Dodge Six, shown above, was slowest, 15 m p.h. Plymouth and Chevrolet did it at 25 m p.h.

Each car was taken over miles of rough dirt roads to determine handling qualities under such conditions. This is the Plymouth.

'59 sixes road-tested by PS: Which is best for you?

				per galie idy speci			Seconds to climb	Speed	
	30 m.p h.	40 m.p.h.	50 m. p.h.	80 m.p.b.	70 m.p.h.	ae m.p.h	Office per gallen on 277 S-mile test-run	grade in law gear	at top ut 32 % grade (m.p.h.)
CHEVROLET	27	26	23	21	18	14.5	20.3 at 45.6 m.p.h.	23.6	25
FORD	20	21	19	17	14	12	16.4 at 45.1 m.p.h	28.5	20
PLYMOUTH	26	24 5	21	19	17	14	19 at 44 1 m.p.h.	22.7	25
DODGE (automatic transmission)	24	25	24	20.5	17	14	16.9 at 44 m.p.h.	35.9	15

that Ford is the lightest, with Dodge, Chevrolet, Plymouth and Edsel following in that order. The brake-lining area by pound of car weight shows an unexpectedly big range: Edsel trusts 22 pounds to each square inch of lining; Ford and Plymouth load somewhat over 19, Chevy about 18, and Dodge an impressively low 17-odd pounds.

Do sixes really save money? They certainly seem to. The average cost is \$120 less than a V-8 of the same make and model. Which means about \$15 saved on taxes and finance charges. Then your first cost may also be lowered if you

decide to do without power steering and power brakes (sixes are a trifle lighter on the front wheels) or an automatic gearbox (which isn't as happy with a six as with a V-8).

Your savings continue: You can look for maybe two to five more miles per gallon—and it'll be regular gas, not that three-and-a-half-centa-extra stuff that most V-8s learn to lap up. Finally, you save on maintenance and repairs. Sixes are easier to work on, and cheaper to keep in new parts. Example: A recondi-

tioned carburetor for a six can be bought for \$15, whereas a four-throat V-8 job can set you back a solid \$50. And it's reasonable that sixes won't insist on so much garage time: They are easier on clutch, drive line, and tires; and they don't tumble out of tune as easily as do more sensitive power plants.

A licking on trade-in? The old story used to be that "sixes are worthless as trade-in cars." We checked at several wholesale auto auctions and found that now, at least, there is no truth in it. Depreciation varies by make and year, of course, but in general the depreciation of fairly recent sixes has been no worse—and sometimes it's even better—than that of V-8s.

Can you walk in and buy? I checked a number of dealers and found very few sixes on display. The reason seems to be that dealers stock a six or two so they can advertise low

Ford six pauses in test run to refuel at a Mojave Desert pump Under the hood, Ford and Edsel sixes are identical

Power plants and prices: How the new sixes compare

	Price	Harzagewer at r.g.m.	Terque at r.p.m.	Bore and strake (Inches)	Displacement (cu. m.)	Compression	Englac	
CHEVROLET	\$2,247	135 @ 4,000	217 @ 2,000	3% x 3%	235.5	8.25:1	OHV	
FORD	\$2,219	145 @ 4.000	206 @ 2,200	3% x 33%	223	8.4:1	OHV	
EDSEL	\$2,545	143 @ 4,000						
PLYMOUTH	\$2,232	112 @ 1 600	205 @ 1,200	314 x 4%	230	8:1	Flat head	
DOOGE	\$2,515	102 @ 0,000	203 (0) 1,200	A-17 A-17	230	0.1		

Prices, but they'd naturally rather sell the more profitable V-8s. So you'll find them, when you do, nailed to the ground in back lots or buried behind rows of loaded gook wagons.

Chances are that the salesman will work at "up-grading" you to a V-8, perhaps pointing out that you can drive this lovely V-8 home today, whereas you'd have to wait for a special order to come through on a six. To get what you want takes only firm patience.

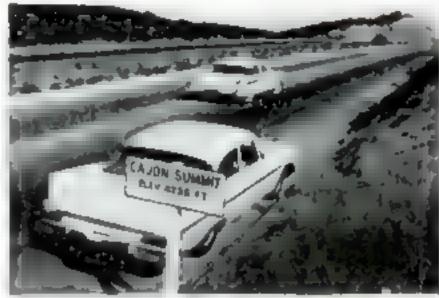

Does a six make sense? This depends, obviously, on the answers to a lot of special questions: where you drive, for what purpose, in what way, even what kind of person you are.

First, what's wrong with them? Plenty, if you drive in hilly country, if you haul a boat trailer, if you like to load the fam-

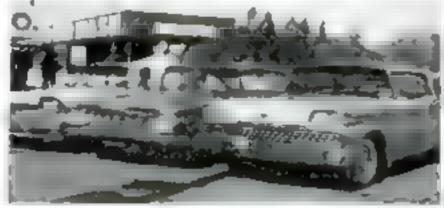

ily and plenty of gear in back and just take off. You could do these things in a six but it might not be much fun. With heavy loads, on steep hills, and at fast touring speeds, you are apt to find when you push down hard that there's nothing much under the throttle but a firm floorboard.

On the other hand, it seems to me that the six is almost ideal as a commuting car, a business car, or one for the usual run of school trips, shopping, and home errands. The six is also good, though perhaps just a trifle less so, as a second car in the family, paired up with a high-performance sedan or wagon. (I make that partial qualification because some small-car buffs would argue that a six isn't a big enough step in the second-car

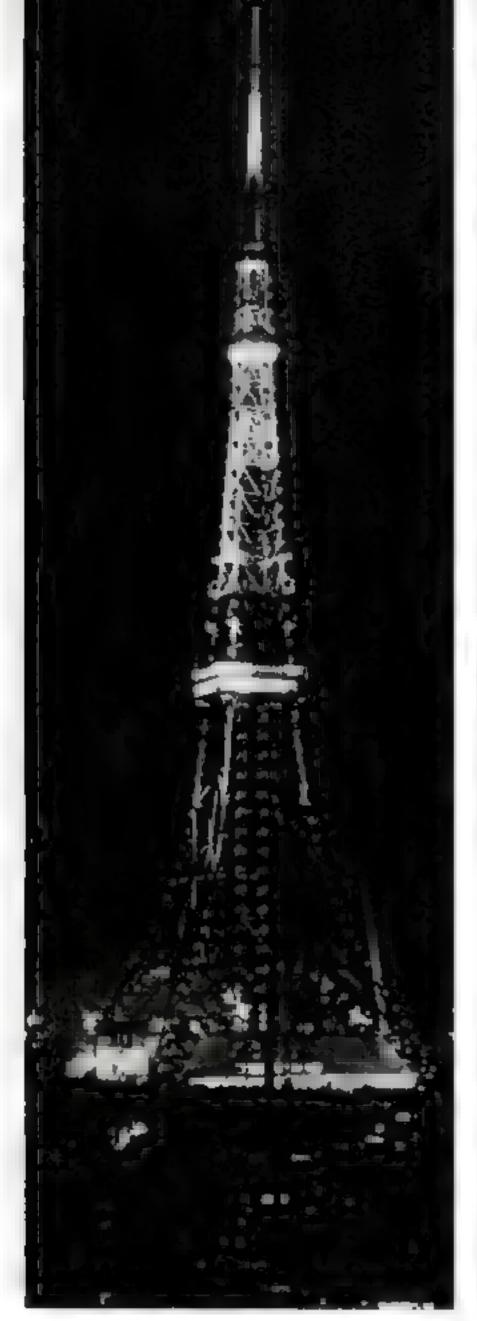

direction.) Third, a six makes great good sense if operating a standard-size car at the lowest possible cost is important. If you drive average passenger-car mileage each year, you can figure that a six will cost you about \$120 less a year than a V-8. Worth thinking about, isn't it?

The sixes were tested at altitudes ranging from sea level up to Cajon's 4,255 feet.

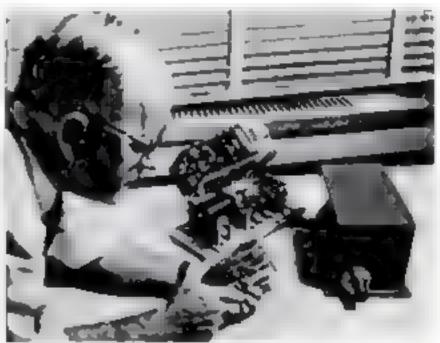

At the end of the 275.5 mile run, three of the four sixes line up for a wash.

ORIENTAL EIFFEL. Higher than the original—1,092 feet to 984—this Tokyo TV tower bears a strong resemblance. During its first two opening days, 28,000 people visited its observation levels.

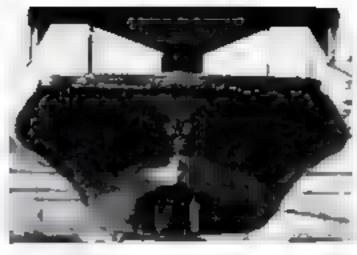

INSIDE BUBBLE. The blown-up nylon tent above is pitched in the middle of the big Lockheed plant in Georgia. It gives privacy to a team developing techniques for building the tri-sonic B-70.

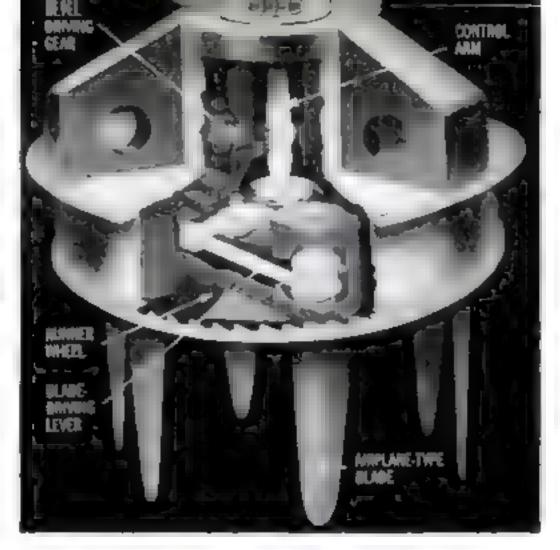

SUN VIEWER. This RCA-built TV camera will help astronomers see the sun more clearly this summer. Mounted on a telescope in a balloon 80,000 feet up, it will assist in focusing from the ground.

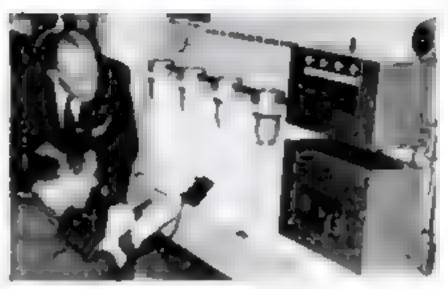

HANDMADE CAR. Here's an auto that never saw an assembly line. The 35-hp. Moretti is hand-assembled in Italy. It will do 90 m.p.h., go 38 miles on a gallon of gas. Cost: \$2,495 in New York.

STEERING PROP. A German propeller resembling a paddle wheel on its side develops thrust like a sculled oar. It steers as well as drives the ship ahead or astern without changing direction or speed of rotation. At stern, center or bow, it's used on ferries (above), launches, tugs.

NUCLEAR FIRE ALARM. Radium radiation from these cylinders ionizes combustion gases, registers on a control box (right). The Pyr-A-Larm detectors are spotted strategically in a building.

BLOW-UP BOAT. Packed in a duffle bag, this inflatable British boat takes little space, weighs 23 pounds with paddles, thwarts and a transom for a 1½-hp. outboard. It carries three people.

DRIVERLESS TRACTOR. Pickup coils straddling an underground wire guide this farm vehicle built in England. It can follow a fixed route, stop at animal-feeding points, unload fodder without aid.

THE OCTOPUS:

Nature's Phony

Willain

ENRY J. BRUCE, a British naval diver, met his octopus off Gibraltar. Forty feet down, he stooped to pick up a pair of overalls on the bottom. The overalls rose and danced.

When octopus arms thrust out and the suckers gripped him, Bruce was terrified. But not too terrified to forget his knife. It worked. A stroke between the eyes—the standard thrust prescribed for divers—destroyed the animal's brain. The tentacles relaxed. So did Bruce—after he had himself hauled up.

Bruce's story is typical. It shows what happens almost every time a man en-

counters an octopus:

 The octopus scares the daylights out of him.

The man is almost always unscathed.
 A streetcar full of passengers once met

an octopus-right in the car.

The car was on a supposedly quiet run, in one of Britain's Channel Island towns, when the cephalopod was spotted. He was taking a seat in the car.

What was worse, the seat was occupied. The octopus was wriggling into the lap of a passenger. The passenger screamed

and dissolved into hysteria

One man aboard was not terrified. Dr. Alan Stephenson, a marine zoologist, owned the octopus. He had been carrying it in a wicker basket. He retrieved the animal and laid it back inside.

Fear of the octopus is needless. That is the unanimous conclusion today of teuthologists (octopus scientists). "In my opinion, they're virtually harmless," says Kenneth Norris, curator of Marineland of the Pacific.

"I don't know of an authentic case of a man killed by an octopus," James W. Atz, associate curator of New York City's

new aquarium told me.

There you have it: In spite of everything you've heard or read, there has never been a single proven instance of an octopus killing a man. Atz has one word he says describes the cephalopod best: timid.

Why, if the octopus is the world's biggest false alarm, does it cling to its position as the world champion frightener

Even after capture, an octopus keeps running away. With no skull or bones, he can slither through a crack.

of men? N. J. Berrill of McGill University, Montreal, believes one reason is that it looks like a nest full of snakes. "Snake shape," he says, "Men are allergic to that shape." Then there's another reason for octopus scares, Berrill explains: "Tall tales. Tall tales that are mostly untrue."

In 1866 the tallest and most untrue tale of all gave the modern world its concept of the octopus. Victor Hugo, in a novel, drew on his vivid imagination rather than on scientific facts: "No horror can equal the sudden apparition of the devilfish, that Medusa with its eight serpents." "A glutinous mass endowed with a malignant will." And so on, for 20 pages.

Hugo's book, Totlers of the Sea, was a smash hit. Thousands read it. Famous French restaurants served with special sauces the creature that Hugo had described as "a monstrous embodiment of disease" with "gangrened and scabrous flesh." Paris milliners created an octopus hat so French mademoiselles might add to their charms by wearing replicas of the creature Hugo called alimy and loathsome.

Hugo won some praise from teuthologists because, by his Frankenstein prose, he did something no other man has ever done. He made the octopus popular. But

Hugo said the octopus drank human blood, ate human flesh

teuthologists, who today are working to restore the octopus' popularity, had second thoughts about Hugo when they realized how untrue his tall tales were.

"He who writes these lines, has seen with his own eyes at Sark (in the Channel Islands) an octopus swimming and pursuing a bather," Hugo wrote.

If Hugo saw that, teuthologists say, he

is the only man who ever did.

"This is the most obvious misconception," says Kenneth Norris of Marineland. "They're very retiring, shy creatures. For a swimmer, the danger of being attacked by an octopus in American waters, on any coast, is about as great as the danger of being blown up by an exploding pumpkin in a cornfield."

An expert's testimony. Norris, 35, who makes five hunting (or fishing) trips a year around California coastal islands, sometimes skin-diving, would give anything if only the octopuses would come after him. Instead, they run away into

The owner of the octopus retrieved the creature, laid it back inside the wicker basket, and the fright subsided.

crevices in rocks or in shell beds or in burrows on the sea floor.

They are extremely clever at hiding: They often build their own homes by moving and stacking rocks and shells and excavating the sea bed by means of their ability to jet water. Then they go inside and close the door by hauling a rock or shell after them.

If they can't take shelter, they hide by changing to any of an incredible spectrum of colors to match almost anything around—yellow, brown, white, maroon, gray, pink, striped or dotted—even blue, green or transparent to blend with the water. In extreme cases, they squirt their ink. Brown or purple, it hangs briefly in the water in the startling silhouette of an octopus to let the real quarry escape.

As the octopus usually eludes him while skin-diving, Norris often finds himself trying something else. He lowers to the bottom an octopus doghouse. This is a cave-like coffin with an opening that, he hopes, an octopus will climb into. If one does, he has difficulty, on the deck of his boat, in getting the timid creature out. It usually won't come voluntarily. Norris tosses in a starfish. The starfish has claws on its back, and pinches the cephalopod, which then emerges. Norris puts the octopus in a tank of iced sea water for the short trip to the Marineland aquarium.

Octopuses are escapists. Even after capture, they keep running away from men. For 30 years, this habit of theirs has plagued Christopher W. Coates, head of the New York City aquarium. The octopus that rode the street car shows one way they do it. Possessing no skull and no bones, an octopus is almost all muscle and flesh. He has an incredible ability: He can flatten himself almost to the thinness of a sheet of paper and slither through a crack you can scarcely see. The street-car rider thus had oozed out of the wicker basket under the tightly closed top.

Coates has had octopuses escape from nailed-shut cigar boxes and from cages of ½-inch wire mesh. In tanks, aboard ship, he had something else happen: They got seasick. Like you, an octopus when seasick wants to die. Unlike you, the cephalopod often does.

They're hard to fool, too. Even in the aquarium tanks, Coates's timid octopuses continued to hide—this time from the public—either in the rocks in their tanks, or by protective coloration. People saw the aign "octopus" and nothing else. Coates received protests. He knew octopuses, nocturnal, normally are active only at night. To get them to move instead by day, when the crowds were on hand, he darkened their tanks, left on

. . . Nonsense, he eats crabs

only a blue light. This did not fool a

single octopus.

Like the critter aboard the streetcar climbing into a lap, and like all octopuses, Coates's began to climb. An octopus can climb, walk and swim with ease. In New York City they climbed right out of their aquarium tanks into the nearby bay.

Thinking he had none left, Coates drained the tanks. He found six, beneath some coral. They had hidden—even from

him.

Octopuses prefer sea food. Victor Hugo said the octopus drank human blood and ate human flesh. This is plain nonsense. What the octopus eats is mostly crabs. It also consumes fish, crustaceans, worms, scallops, mussels, clams, other octopuses and, in emergency—often just before death—parts of its own armlike tentacles.

In turn, it is eaten mainly by large eels (Moray and conger); by whales, seals and sharks; and by men, especially in Asia, Africa and the Mediterranean region.

"It has a flavor like shellfish," says Ken Norris. "Very good. But it's a problem to dislodge the sucker disks from the

roof of my mouth."

Octopus meat can be tough. "I chewed a single tentacle the greater part of a morning," said another scientist. Natives have learned to beat the octopus to tenderize it. In Hawaii, old washing machines are used for the purpose.

Hugo made it out that his octopus, a resident of the Channel Islands, was a huge monster capable of drowning a man. Actually, a few cephalopods around there sometimes have arms 21/2 feet long, weigh maybe 20 pounds. On our North Pacific coast, 50- or 60-pounders, with sevenfoot arms, are fairly common. The biggest Norris ever caught was an 85-pounder with 9½-foot tentacles. In the South Pacific the arms stretch out to a length of 14 feet—but they get mighty thin and stringy. Even there, a 200-pound cephalopod would be a giant. Many octopuses are tiny: The tentacles of some adults never exceed an inch in length.

Hugo had his beast try to gouge out a man's eyes with its tough beak. Every octopus has a beak but, Kenneth Norris

Retiring and shy, they are extremely clever at hiding . . . And sometimes they get seasick, even as you and I.

reports, the large ones don't bite humans. "I've handled quite a lot, especially the big ones, for the last eight years," he says. "They've never bitten me."

It's the tiny ones that bite. "A little bitty one in the Gulf of California," says Norris. "Inch-and-a-half arms. He's the one that fights. He bites. He has an anti-coagulant in his saliva. You keep bleeding. It hurts like the deuce."

Hugo said the octopus could crush a man, like a boa constrictor, and also choke him. In spite of the pressure you feel when the arms enwrap you, this is more balderdash. The octopus neither

squashes nor throttles.

The only wounds on record, from any octopus, besides the bites of small ones, are occasional red marks, with the skin rarely broken, where the suckers have

gripped.

Teuthologists agree with Hugo on one detail: The grip of the suckers is strong. Hugo guessed an octopus had 500; actually, most have 240 on an arm, or 1,920 altogether. The suction cups are better than those on your windshield because they can curve around and adhere to a round surface like your arm. They are, says a U. S. naturalist, one of the most efficient systems among animals for capturing prey, better by far than claws or teeth, and inferior only to the hand of man with its opposable thumb.

But the grip is not unbreakable. Caught by a South Pacific big one, a diving U. S. scientist bent his legs, thrust up from the bottom, and by himself jerked the octopus loose from its anchorage, and brought it up with him. Murray A. Newman, curator of the Vancouver Public Aquarium, says that his skin divers work this way as routine. They go out and try to persuade octopuses to wrap

ATOMIC POWER—DIRECT. What started out as an improvement in controls for gas heaters has ended up as an atomic casse-

role (bottom photo) that cooks up electricity for space satellites. The five-pound unit generates five watts (enough to light three flashlight bulbs) for five months—yet contains no battery or dynamo. It converts heat from splitting atoms directly into electricity

The space power package contains a

1/50-ounce pill of polonium. Its disintegrating atoms create heat (720 degrees F.). Around the polonium pill are 10 thermocouples of lead telluride. Heat pushes away electrons in one leg (n-type) of each thermocouple. In the other leg (p-type), heat pushes away "holes" — spaces for electrons — and sucks in electrons from the cold end. So electricity flows up one leg, down the other.

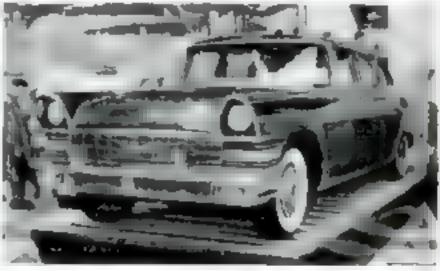

Martin Co. designed the heat pill, while 3-M (Scotch Tape) worked up the generator from a development started by a Milwaukee heater-control firm, Baso, Inc. Baso already uses similar units in self-powered thermostats for room heaters (they get their heat from a gas flame, not atomic pills).

GHOST RIDER. This eerie instrumented dummy astride a 1,200-m.p.h. rocket sled tests the effects of tremendous wind blasts on its protective suit for the Air Research and Development Command at Alamogordo, N. M. The 165-pound dummy weathered a 35,000-foot run in good condition.

FIVE TIMES SOUND. Model of the X-15 in a Mach 5 speed test in Cornell Aeronautical Laboratory's shock tunnel. The North American rocket [PS, Jan.] is the first built to fly man into space.

RED SPECIAL. Latest from Russia is this seven-passenger Zil-111. It has power steering and windows, and power brakes cooled by fins acting as blowers in the hubcaps. It can hit 105.

LEAPFROG. Getting an assist from a Sikorsky S-56, a five-ton M-56 tank armed with a 106-mm. rifle surmounts an obstacle during training demonstrations at the Army infantry center at Fort Benning, Ga. Whirlybird lifts enable tanks to cross water, swamps and other difficult areas, cover ground quickly to drop them into position for engaging the enemy.

imitative "firings" with realistic toys.

MARCH 1959 29

By Frank Harvey, with photos by W. W. Morris

metto scrub of Cape Canaveral, the Atlas ICBM, cinched to its launching pad, looked like a silver fountain pen in the blaze of floodlights. I adjusted the field glasses and the bird came to me, big and with exciting detail. Her flanks were snow-white from the frost caused by liquid oxygen. She was puffing white lox vapor through her top vent holes. Beside her, tall and candy-striped, was the tower that carried the electrical umbilical cord.

Over the bullhorns a matter-of-fact voice said, loud and clear: "T minus two minutes and counting."

The skin prickled on my neck and I looked south to the lights of Cocoa Beach, the nearest town, glittering on the horizon 15 miles away. Fifteen miles was nothing to an ICBM. Not long ago a Po-

The double map below shows where Cape Canaveral lies in respect to near towns and to the rest of Florida.

Growing pains hurt, but there's no crime in exciting, missile-happy "whoom" town

laris IRBM had gone crazy on launch and a hefty chunk had exploded in the Banana River a short distance from a Cocoa Beach tourist court. But Polaris was a baby compared to Atlas, If that frost-encrusted monster on the pad got loose and smashed its 100-ton burden of lox and RP-1 fuel into Cocoa Beach, there might not be enough left to write the story I'd come for: a close-up look at this first American missile town.

But disaster was unlikely. Lt. Col. Ray Stephens, sitting at his Destruct Button in Central Control, could blow a wandering Atlas to flaming bits in a single heartbeat.

The bullhorns rumbled, "T minus 90 seconds and counting." I harrine-focused the glasses on the complex. Magnified by the lenses, it looked like a Technicolor movie set: the white monster under the lights . . . the now loosely dangling umbilical . . . the brightly flashing red warning light . . . the huge gantry tower, partly in shadow . . . and behind it all the vast Atlantic and a velvet sky with stars as thick as spilled gold dust.

"You guys lucked it," said Dick Roper, who works for United Press, "Some people wait for weeks. You and Bill Morris show up in the afternoon, and they shoot an Atlas the same evening."

"We came to do the town," I said, "but

a shoot's a fine start. After all, if it weren't for these birds, Cocoa Beach would just be a wide place in the road between Daytona and Miami."

"I beg your pardon," said Roper, a man with local pride. "Cocoa Beach was—and is—the sea-trout capital of the world. And since you've mentioned Daytona—50 miles above here—our beach is just as good as theirs, only not quite so long."

"Thirty seconds and counting," the bullhorns informed us.

"Not to mention our oranges," said Roper, "Indian River fruit—"

"For Pete's sake," a photographer yelled in the dark, "will you guys stop yacking and hold still! This platform wiggles if anybody breathes on it . . . and I'm shooting alow!"

Everybody sort of froze, and I could feel the soft breeze from the south.

"Ten," the bullhorns intoned. "Nine . . . eight . . . seven . . . six . . . five . . ."

At the count of three the vernier engines lit—two orange blowtorches snapping on suddenly on the big bird's flanks. The count went down to zero.

A rich stream of orange fire, looking like molten steel, flowed out of the flame bucket and was instantly smothered in boiling clouds of steam. Then, still in utter silence, the monster rose torpidly from

A drag line scoops up new land for more houses from the bottom of the Banana River

Cocoa Beach's city hall is a one-story shack, with a brand-new sidewalk in front,

its pad and hung in the air, drifting sideways in the breeze. The rich orange of the deflected fire was gone now. The three engines of the Atlas made an intolerable sun-glare. The cape was lit with an evil, acid brightness that made you think of the destruction of cities. Fourteen seconds after the first sign of fire, the sound arrived at the press tower—a guttural, phlegmy roar, like an enraged giant with a bad cold.

The Atlas rose slowly, balanced on its sun-bright tail, "programed" over gracefully and headed out. Soon it was a small, victous torch against the stars. The torch winked once, as the boosters fell free

Finally, about 200 miles away, 100 miles high, and moving 15,000 miles an hour, the firefly speck burned out.

"Starlite Bar, here we come!" somebody yelled, "We got us a green bird tonight!"

Twenty minutes later, official word came through. This particular Atlas had worked perfectly and was now far downrange. It was up there in the poison wilderness of Van Allen radiation, 1,000 miles high, and falling with inexorable accuracy toward its impact point.

The Starlite Bar, unofficial press headquarters in Cocoa Beach, was roaring happily when I arrived with B. G. Mac-Nabb, field manager for Convair and the man in charge of the Atlas just fired. We took seats under the hurtling moons and meteors that decorate the walls of this bistro, and pretty girls in thigh-gripping leotards and space tunics served us Atlas Specials—a multi-propellant drink with a small blue flame hovering on the surface. "Pretty active party," I said

"Dead," MacNabb said. "You should have been here in the early days after a good shoot. One time they threw about a hundred chairs in the swimming pool. Matter of fact, they got to throwing people in later—fully clothed."

"Nobody got sore?"

"Look," MacNabb said. "You go

Just in case a tourist doesn't realize where he is, this busy road sign near town ought to tip him off.

through a month of get-ready. You go through a three-day count. Then you put one in the little barrel 6,300 miles away. Man—it's a privilege to get thrown in some pool. After a good one you don't just sit down and blow on your fingernails. And that goes for about 90 percent of the people in this crazy town. They're

missile-happy."

After World War II: acres of rattlers. I discovered, after a week of looking into every nook and cranny of Cocoa Beach. that MacNabb was accurately describing this fabulous place. But when a Navy air base was deactivated after World War II. Cocoa Beach, about 190 miles north of Miami, was about as dead as a harpooned flounder. Vacationists whizzed by on Route 1, and about the biggest transactions were consummated between trout fishermen and bait ralesmen. Shrimp were going for a penny apiece, when there were any takers. Taxes were so low that the county authorities didn't bother to collect them until they were over that way on other business. And Cape Canaveral itself—the name, pronounced Ca-nav-er-al, means "cane plantation" in Spanish, the language of its early christeners—was probably the raunchiest-looking bit of real estate on the east coast of Florida: an ocean-pointed wedge of 15,000 acres of sand, palmettos, rattleanakes, and noth-

These times, a charming and mild-mannered man named Gus Edwards told me. were just about the low point in his personal real-estate career. Gus had had a crazy dream: If you bought a big spread of beachfront and held it long enough, you'd make a million dollars. In 1917. Gus had bought 21/2 miles of beach property where Cocoa Beach now stands, for \$1.50 an acre. He had paid taxes on it ever since. At one time he had even gone north and worked for years in Yankeelandto keep those taxes up.

"Sell out, Gus," they told him. "The stuff's gone to \$3 an acre. You'll double

your investment, man!"

"Double," Gus Edwards said. "I'm not interested in double. I'm holding out for money."

They laughed at poor old Gus—until

At Vandenberg, 3,000 miles west of Cape Canaveral, a

THIS LAUNCHING PAD AT Vandenberg AF Base is where the first Thor was fired over the new Pacific Missile Range. The dark object at center is the missile mount. The white shed at rear rolls forward to cover the missile, which hadn't arrived for the shoot when this picture was taken.

On a bulge of California's coast, 168 tniles northwest of Los Angeles, lies 64,000-acre Vandenberg Air Force Base. But two years old, it is the only missile training center in the U.S. Already it swarms with 4,000 airmen, and before this year is over, it will swell to 8,000.

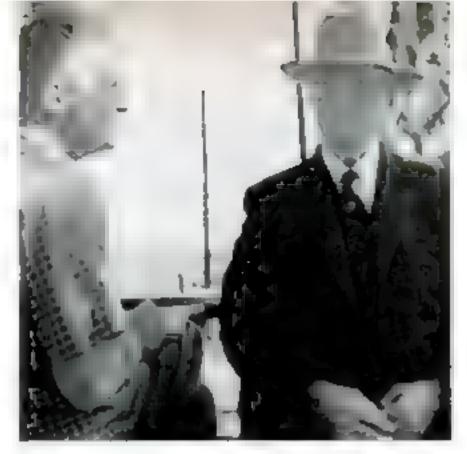

Vandenberg has a three-fold mission of the utmost urgency. It must turn out skilled crews to man ICBM bases in this country, crews for IRBM bases abroad -and it must turn itself into a combatready ICBM base.

Down among the dunes that skirt the

the missile base arrived. They are not laughing at him today. He watched his 13,200 feet of choice ocean-to-river property rise to \$300 a front foot. And he held. It went to \$500 a front foot, and he sold. He is not saying just what he sold and for how much, but if you multiply 13,200 feet by \$500 a foot, you arrive at \$6,600,000. And maybe Gus was a sucker at that. The stuff has moved to \$700 a foot—and smart Miami money is betting it'll go to \$1,000.

Whoom and bust? "Some old-timers are still worried," Gus Edwards says. "They remember the first Florida boom that burst like a soap bubble. They recall how it was after the Navy left the air base. They figure it may happen again: All these missiles may pick up and leave." Gus shifts his unlit cigar and grins. "I tell them it can't happen. Sure, there's another firing range out in California—but from what I hear, it's not going to take any missile business away from us."

Informed opinion backs up Edwards. Cape Canaveral, the headline-making

Having owned, and sold for millions, most of Cocoa Beach, Gus Edwards (right) is now "making" new land to sell.

part of the Air Force Missile Test Center, which also includes Patrick AF Base and a 5,000-mile test range, would be hard to duplicate. It's a semi-island, easy to isolate and guard compared to a mainland site. The climate is fine for missile

[Continued on page 244]

far bigger and hotter missile base is fast taking shape

chilly, fog-breeding Pacific, eight launching pads for 1,725-mile Thor missiles have already been built. Ninety degrees to the north of them, and about three miles away, stand a gaunt trio of widely dispersed, 130-ft, servicing towers for 6,300-mile Atlas missiles. More are building.

Precisely dotted across the adjacent plain are white-domed radar stations, for tracking missiles in the first few miles of their long trajectories through

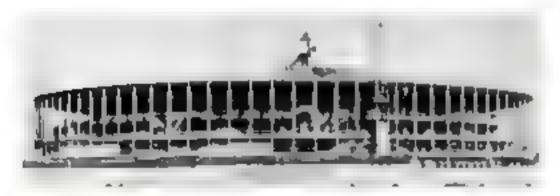

Vandenberg has one great physical advantage. Unlike Canaveral, it has access to vast areas of empty ocean in several directions. From it, ICBMs can be fired full-range. Directly south, the nearest land—the tiny Pitcairn Islands—is more than 4,000 miles away. That makes it the only U.S. base from which satellites can be launched into a polar orbit, vital for scanning the earth's settled regions, without risk of dropping a booster rocket on a city.

A THOR STARTS RISING to firing position, still fastened to the trailer that trucked it to the launching site. The trailer remains attached until the missile is vertical.

EAR DOCTORS. Telephone-service men here calk the seams of a 60-foot parabolic antenna in the White Alice all-weather communication system in Alaska. Once each year they do this maintenance chore on each "ear" in the 3,100-mile line.

OLYMPIC PALACE. The mammoth stadium above goes up in Rome for the Olympic Games next year. More than 100 feet high, the spectacular building will be topped with a dome over 300 feet in diameter. Cost is \$3,200,000.

SeaMaster jet suppressor converts noise to less-audible high-frequency waves. The steam is from water cooling afterburners.

PUSHBUTTON PHONE. With this new telephone you can dial an ordinary call or push buttons to talk over 12 or more inter-office phones at the same time.

lab work, and thousands of field tests ranging from Florida to Vancouver

But before you rush out and buy a bucketful of either-or of any other acrylic house paint now on the market or soon to be offered---there are equally important things you should know. They start with an understanding of what paint is and where the name "acrylic" fits in. Whether it's thinned with water or a solvent like turps, all paint contains two basic ingredients:

Pigment. That's particles of opaque material that give the stuff its color and

ability to hide what's underneath. It also helps to keep sunlight from breaking down the final paint film. There's little difference between the pigments used in water- and solvent-thinned products.

Vehicle. That's the liquid part, which also has two ingredients:

 Thinner. Without it, you couldn't brush, roll or spray paint on. During the drying process it evaporates.

 Binder. Either a liquid, or microscopic bits of some semi-solid, used to stick the pigment together and bond it to the surface of the work. This is paint's very important film-forming ingredient.

Acrylic is the binder in any paint that bears the name. A synthetic resm closely related to Lucite and Plexiglas, it doesn't dissolve in water, but is dispersed in it, forming a milky emulsion. Manufacturers thus may choose any one of three

accurate phrases to identify their water acrylics: "water-thinned acrylic resin," "acrylic emulsion," or "acrylic latex."

Whatever they call them, do not confuse this type with the new acrylic lacquer now being used on all General Motors cars. If any paint dealer tries to impress you with the "What's good for GM—" pitch, shrug it off. The amazingly tough and beautiful "Magic Mirror" auto finish is not water-thinned; it has a strong solvent that dissolves the plastic. Using it as an endorsement for acrylic house paint is misleading; while both have fine

durability, car lacquer is one thing, exterior wood and masonry paints another.

Easy application. When interior and outside acrylics made their bows in 1953 and 1955, respectively, their futures looked equally bright. They had all of the qualities that had made other latex-type paints big sellers then, as they are today.

Here's a quick rundown:

- Fast application.
 You flowed them on; no tiring roller drag
- Excellent covering power; no lap marks.
 - Practically no odor.

Quick drying. You could put on a second

coat in two hours; no need to move ladders or scaffolds twice.

- Surfaces didn't have to be dry; outside, it was safe to paint right after a shower.
 - Easy clean-up with soap and water.
 - No flammable solvent.

In another department, acrylic had it all over rubber latex, and an edge on polyvinyl acetate. Its film was more rugged. It looked like a natural for house painting.

The Achilles' "peel." But it hasn't worked out that way. Of the seven million gallons of water acrylic sold by more than 550 American outfits last year, only one fourth was used outdoors.

Blame part of that on one shortcoming of all emulsion type, film-forming binders, including acrylic. When exposed to the weather, they do a very poor job of bonding themselves to raw wood, and to previously painted surfaces that are slick, chalky or dirty.

Manufacturers who jumped on the water wagon too soon, plugging untested acrylics as all-surface finishers, undoubtedly set the product back. For a customer never forgets or forgives a bad house paint, and when these "wonder plastics" were spread over anything and everything, they proved about as stable as bubble gum. They cracked and popped

and shriveled and peeled.

Frustrating formulas. Exterior acrylics have moved slowly, too, because there's much more to perfecting a paint than whipping a couple of basic ingredients together. A single formulation may contain as many as 20 or more components, each tossed into the grinding mills for some particular purpose. One may produce low sheen, another reduce pigment settling; a third may provide the slow chalking that, combined with rain, keeps housepaint surfaces looking fresh. In water-thinned products, there may even be an additive to prevent mold growth

As important as choosing or developing the right ingredients, lab men must determine just how much of each to use.

All this takes time. On outdoor exposure racks, a paint sample that looks whitest for the first six months may show the greatest yellowing after two years. And what do you do about the one that chalks too fast in Florida, and too slowly in Arizona

Neither John Lucas nor Du Pont would be offering acrylics today if they weren't convinced they've made important breakthroughs with their formulations.

How about adhesion? Here, there's a parting of the ways.

Lucas says that its new "Luco-Tex" product is suitable for all exterior surfaces

How many engines does this rig have?

How many engines? Four: one under trailer, one in "jeep" trailer (on top), two under cab.

Extra Engines Beef Up

about a "Big Wolfer" ahead slowing them down on an uphill climb. "Big Wolfer" is truckers' lingo for a fast new tractor-trailer rig with a Dynassist Wolf Pack—a 130-to-150 hp. International engine—bolted beneath a semitrailer and coupled to its wheels. By flicking a valve on the steering column, a driver can throttle both tractor and trailer engines with one pedal. The extra

punch converts medium-capacity rigs to superhaulers that level hills without shifting, dig out of traffic, and plow through mud and snow that would bog down ordinary rigs.

Dallas engineer Lloyd Wolf, who designed Dynassist, also offers Twinassist—dual tractor engines—and a "jeep" trailer that couples between semi and tractor to provide still more power.—

John Rogers.

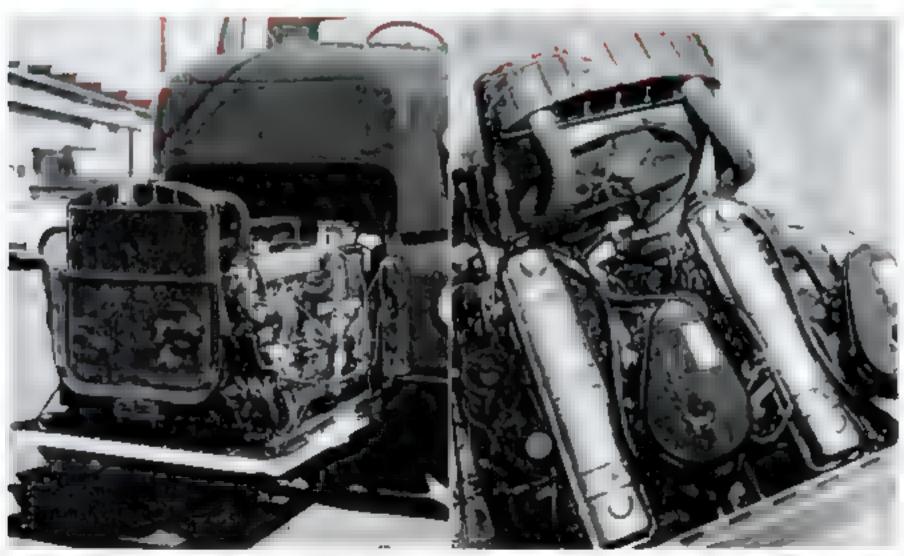

Trailer engine gives extra push on hills to help tractor. It has an automatic transmission.

For extra power on heavy houls, jeep trailer is coupled between tractor and semitrailer.

Heavy Highway Haulers

TWIN ENGINES ROLL OUT for repair. The two engines weigh less and cost less than one of equal horsepower, says Wolf At cruising speed,

one engine idles—saving fuel—while the other pulls the load. As acceleration increases, the idling engine revs up to help its mate.

Now the Chinese Are Making Cars

THE Chinese Communist colossus is striving mightily to put itself on wheels—in the past year its infant automobile industry has produced nearly 200 different prototypes of cars, trucks and tractors.

Despite strong Russian influence in the smacking-new factories, the latest Chinese models shown in the photos at right suggest a mixture of Western styling ideas.

The Eastwind, at top, powered by a 70-hp. overheadvalve engine, bears a flattering resemblance to a British Ford Consul, Yet an advertisement in an English-language magazine aimed at the export trade describes it as a "medium-class car combining quality with distinctively Chinese elegance."

More like a European General Motors product is the sleek-looking Peace four-door sedan just below it, while the smaller two-door Chingkanshan an an amacks of the little French Renault and the British Standard.

The dual headlights, plunging hood and split windshield of the 95-hp. Progress (last in line) point to mixed-up Americana, circa 1928 and later.

100-Hnot Liner to Fly on Sea Wings

An ultra-fast new way to travel, in vessels that ride high above the waves, is promised by the conquest of the sea's speed limit

By Alden P. Armagnac

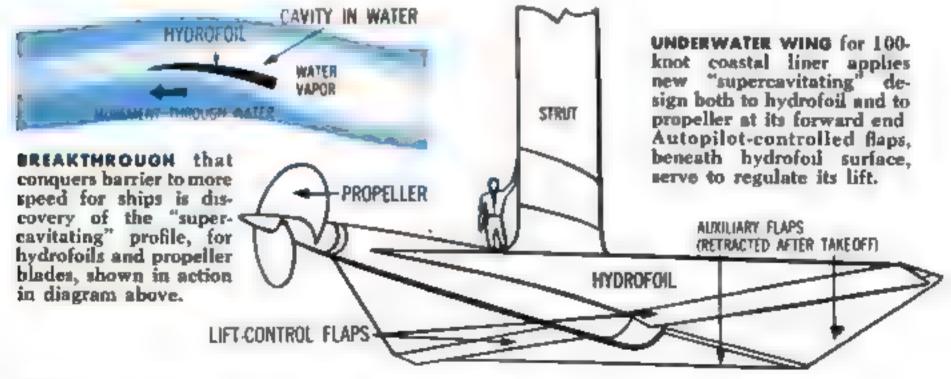

DOD STORES OF BOIL SERVE

You'll skim to Europe at mile-a-minute speed or more, in liners that ride above the waves on stilt-like legs and underwater wings. Coastal liners, of similar submerged-wing or hydrofoil type, will whisk you to vacation climes at a fantastic 100 knots, or 115 land miles an hour. An American breakthrough in marine science makes it feasible to build such ships as these. The long-standing speed limit for seagoing vessels is shattered by a revolutionary new "supercavitating" shape for hydrofoils and water propellers.

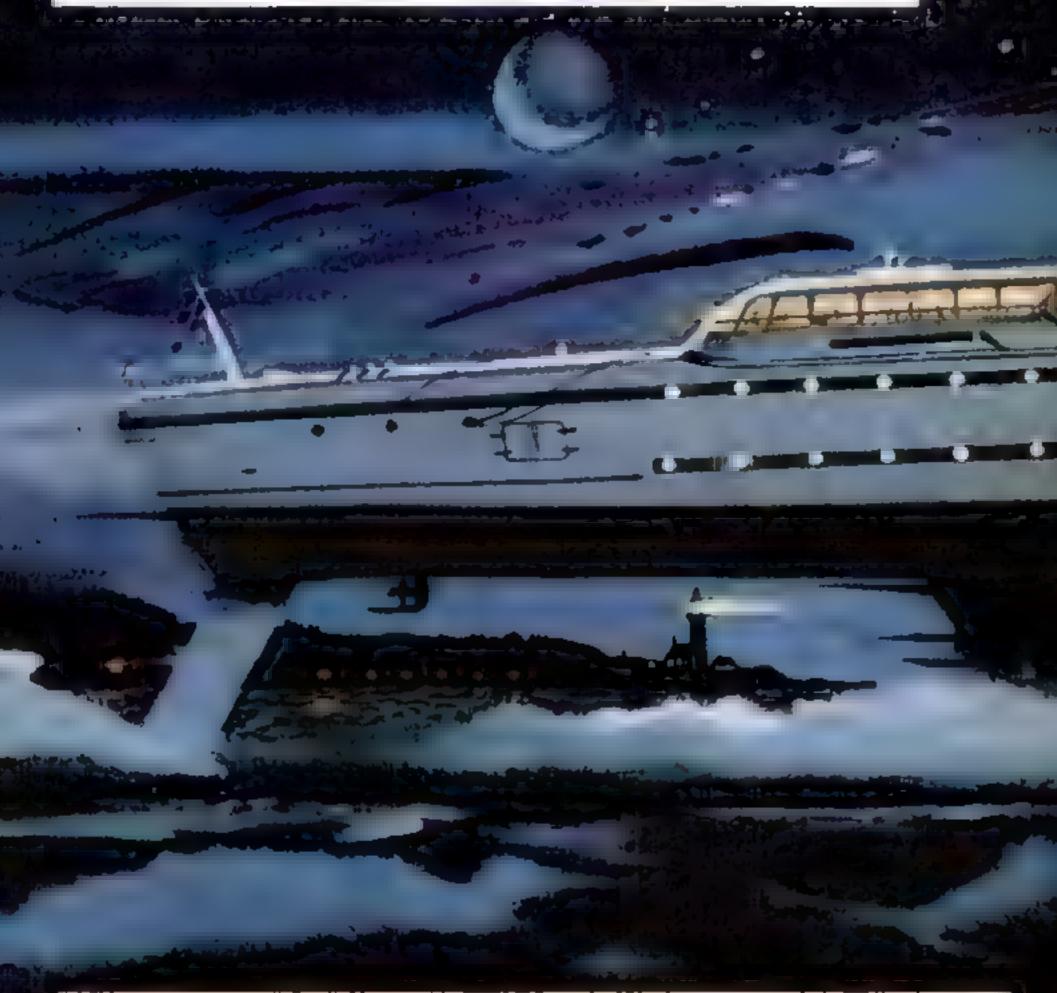

Whether this discovery can be exploited in ultra-fast passenger liners is answered with a "yes" by a six-month, \$75,000 engineering study recently completed for the U.S. Maritime Administration by the Grumman Aircraft Engineering Corporation, Bethpage, N. Y. What some of the resulting ships will look like may be seen in the pictures that follow, based on actual drawings in the Grumman study's three-volume report.

Already under way is the next step to make these dreamboats come true. The Maritime Administration has just commissioned Grumman to design an 80-knot, 100-passenger hydrofoil ship as a prototype. Expected to be launched and cruising by late 1960, this experimental-scale vessel of 70 tons and 110-foot length will be powered by gas turbines totaling 10,000 hp. or more, which will propel the radical craft by driving water pro-

Liner departs with foils retracted, bull submerged, using a non-stance auxiliary engine.

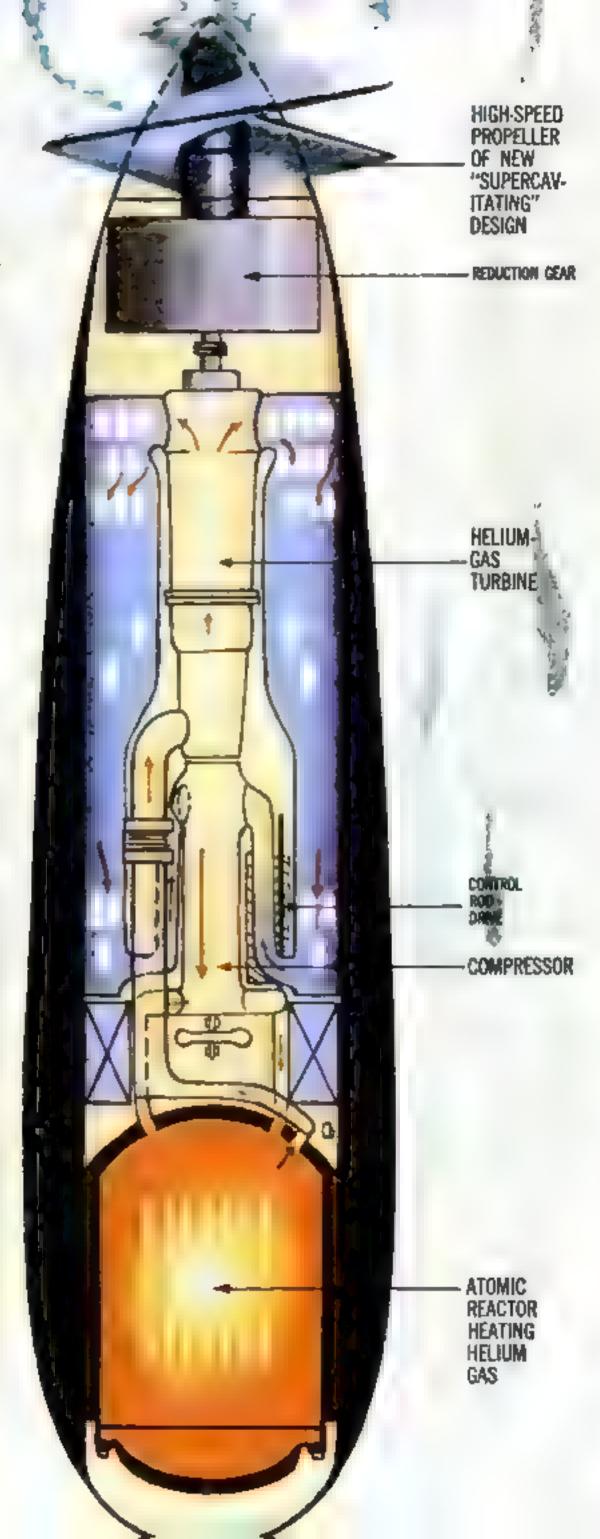

In open water, folk yn down, A-engine starts, and h-II risus from water as vessel gains speed. 🖹

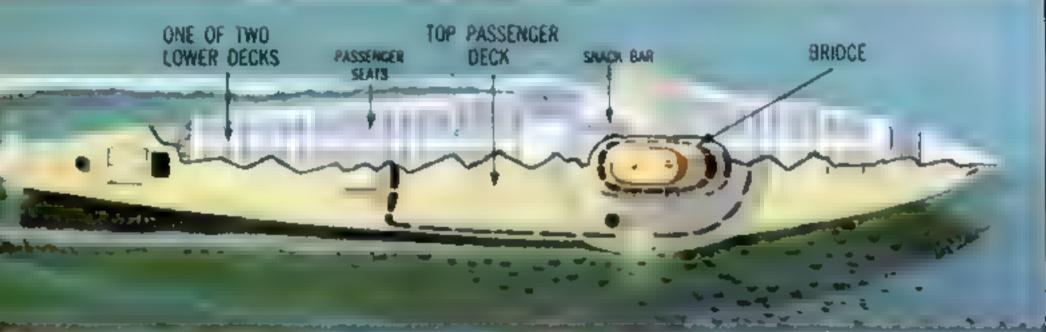

Atomic Engine for A-Liner

Submerged pod, pictured from above, holds atomic reactor, turbine, and gearing to drive single high-speed propeller.

100-Knot Coastal Liner Is Fastest of Designs

THREE GAS TURBINES spin water propellers to drive this 852-passenger, 500-ton craft at 115 m.p.h. Its speed requires all-enclosed quarters, for protection from wind. Passengers' airplane type seats occupy two lower decks, top deck has an observation lounge and bar. Cutaway side and top views show engines and seating.

SIX AIR PROPELLERS powered by individual gas turbines drive scaplane-hulled coastal liner, in an alternate design. This craft would have same passenger capacity, tonnage and speed as the one in upper views. Both are designed to have a cruising range of 1,200 nautical miles, which will amount to a 12-hour run.

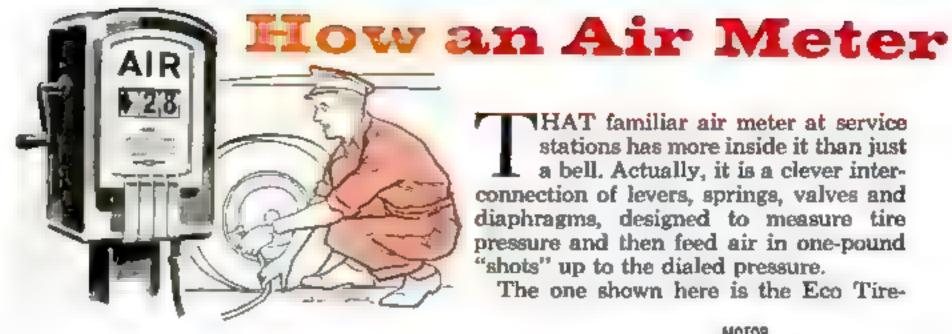

U. S. NAVY'S XCH-4 an experimental 53-foot airpropelled hydrofoil craft, has bettered 70 knots and is called world's fastest open-sea vehicle. Now the Navy is interested in hydrofoil-type landing craft, antisubmarine motor torpedo boats, and coastal patrol vessels.

HYDROFOIL SPEEDBOATS already on market range in size from this Grumman outboard runabout up to 32-foot cabin cruisers. Russian and

Italian hydrofoil ferries, as large as 50 tons, carry up to 150 passengers. New hydrofoil design will multiply uses of fast water-skimming craft.

THAT familiar air meter at service stations has more inside it than just a bell. Actually, it is a clever interconnection of levers, springs, valves and diaphragms, designed to measure tire pressure and then feed air in one-pound "shots" up to the dialed pressure.

The one shown here is the Eco Tire-

MAIN SPRING

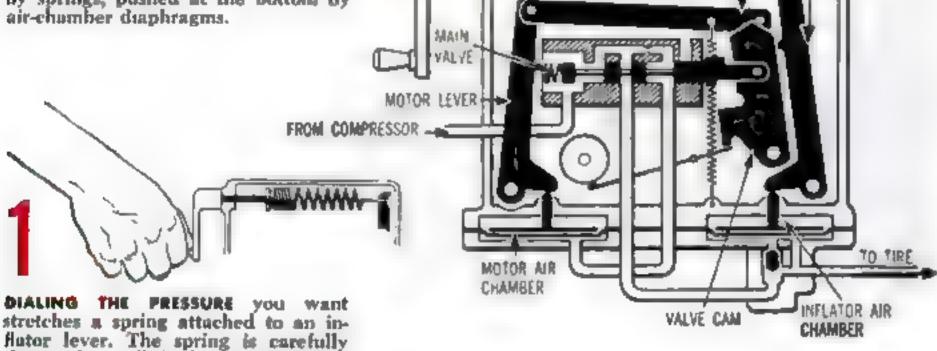

MOTOR ROLLER

LEVER

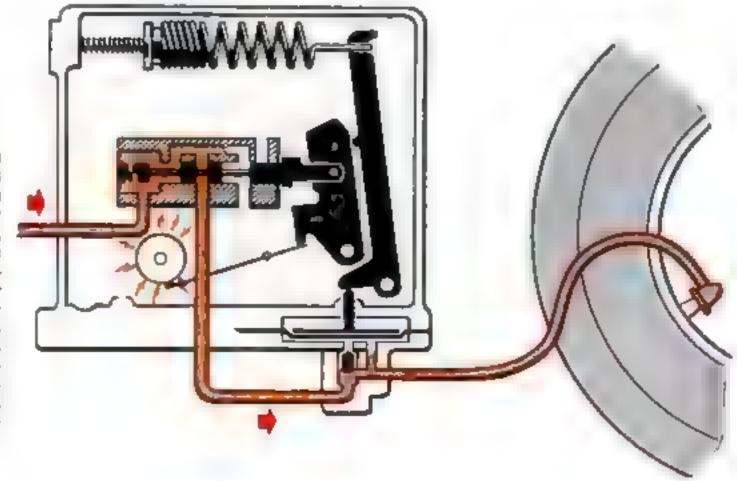

INFLATOR

INSIDE THE TIREFLATOR a valve controls compressed-air flow, It's moved by two levers that are pulled at the top by springs, pushed at the bottom by air-chumber diaphragms.

designed to pull the lever with a force proportional to the pressure dialed.

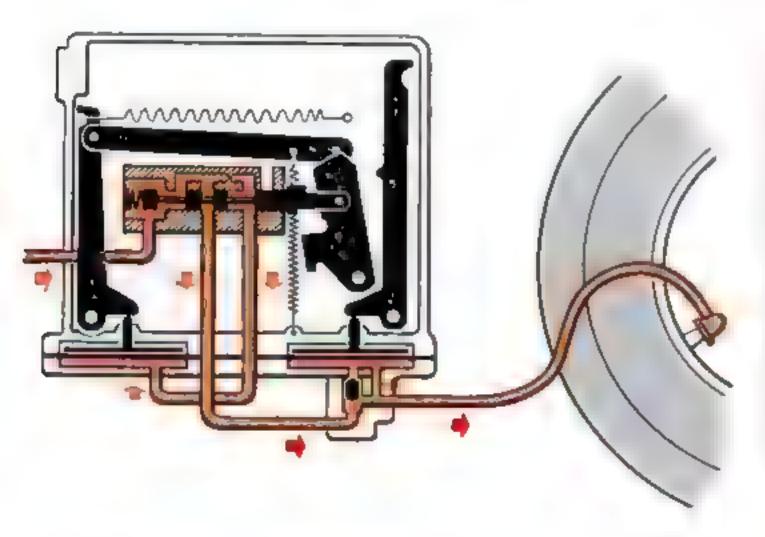

PRESSING THE CHUCK OF a tire valve equalizes air pressure between the tire and the inflator chamber. If tire is low, dialed spring pressure overcomes tire air pressure against the inflator diaphragm. The inflator lever pivots "on," nudging a cam attached to the main valve. The cam snaps this valve open, hitting a bell striker as it does so. Now air flows into the tire.

Checks Your Tires

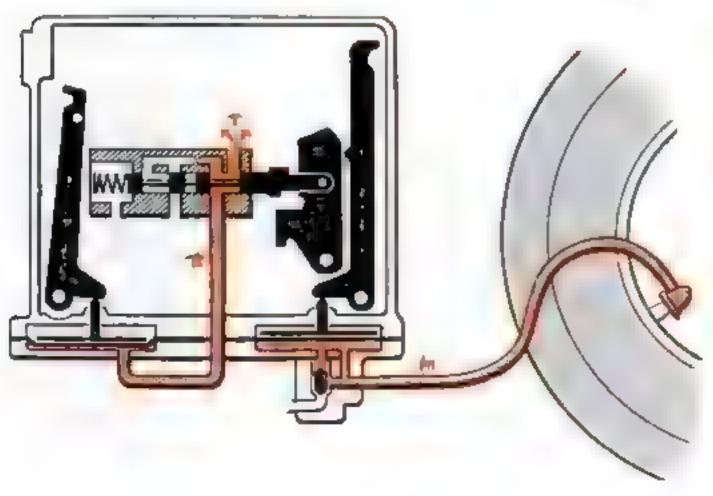

flator, biggest seller in the field. Virtually indestructible, many Tireflators are still pinging away after decades of use. Master gauge checks seldom reveal more than a 1½-lb. error in the older models. The newest model air meter is described here.

The makers of Tireflators have two tips for using their meters. First, they say, let some air out of your tire before applying the hose chuck. This blows out any dirt in the valve stem and corrects possible over-inflation. The air meter will not bleed off excess pressure. Second, keep the fender between your head and the tire while inflating it. A poor tire may choose this time to blow.—Erik Arctander,

3

MAIN AIR FLOW goes to the tire, but two small streams are diverted inside the meter. One goes to the inflator air chamber and the other is piped to a second (motor) air chamber. Pressure quickly builds up in both chambers, foreing their respective diaphragms upward. When a pound of air has passed into the tire, the inflator lever and motor lever are both pushed to their "off" positions.

4

OFF: No longer held open by inflator lever, valve is closed by its spring. A vent to motor air chamber opens as a result, releasing its pressure, and motor lever pivots "on." Inflator lever will also go on again, triggering another one-pound shot of air, if tire pressure is still lower than dialed pressure. If both pressures are equal, the air flow halts.

BIG TILT-WING TRANSPORT. This nation's largest vertical-takeoff airplane, Hiller's X-18 weighs 16½ tons, dwarfs the man standing at its nose in the sequence photos above. It is designed to take off either straight up like a helicopter (left), or from short landing fields with wings and propellers at an angle center), or like a conventional plane

"PICKUP" TRUCKS. New German lift trucks (above) come with hydraulic arms that make loading and unloading fast and easy. The body at top can be raised as high as 105 feet for loading cargo planes or platforms; the other can be laid flat on the ground for rolling loads on or off.

ROCKET PHONE.

The futuristic phone booth below, looking like a space missile, is used by a dry cleaner to advertise his business. At two main Cincinnati suburban arteries, it's in a good spot for both advertising and phoning.

when the runway is long enough (right). Strictly a test plane for the Air Force, its nose and tail sections are from a Chase transport. Two Allison T-40 turboprops and Curtiss-Wright dual propellers were borrowed from the Navy. A Westinghouse J-34 jet in the tail (with long tailpipe) helps control transition from vertical to horizontal flight.

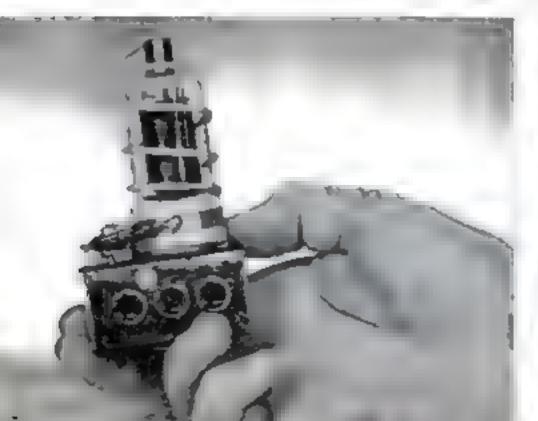

BEACH FERRY.

New Army shallow-draft cargo ship (right) is designed to shove its bow ramp into the stern or side opening of an oceangoing roll-on roll-off vessel [PS, Jan, '57], take off trucks and tractors and move them onto a beach. The 338-foot lighter will be operated by an Army crew.

MOON PICTURE. The tiny crystal-stabilized transmitter below is the core of a Navy-built eight-pound TV camera intended to show the other side of the moon to earth viewers. It is to send continuous lunar reflections from a $2\frac{1}{2}$ -inch mirror when the Pioneer gets near enough.

STICKY STUFF. Pressing buttons and twirling dials on the vending machine below at right dispense the correct number of trade stamps at supermarket check-out counters. It saves time for customers and clerks. The machine is made by Electric Vendors, Inc., Minneapolis.

America's Meanest Little Mountain

A killer, though thousands climb it every year, Mount Washington has the world's worst weather

By Gardner Soule

HE wildest weather known in the world is not that of Siberia, nor that of the Antarctic, nor that off Cape Hatteras (where the wind has reached 110 m.p.h.). It occurs, instead, right in the continental U.S., near crowded centers of population—where you can reach it and sample it easily. Each year thousands of men, women and children do.

The place you'll find the worst weather so far recorded is the 6,288-foot-high summit of Mount Washington, N.H., five hours' drive from Boston. Here, on April 11, 1934, for an instant there occurred the strongest wind ever measured: 231 m.p.h., or 99 m.p.h. more than the greatest breeze ever recorded elsewhere in the U.S., 132 m.p.h. at Miami. The Mount Washington record was the high point of a memorable 24-hour period

Neither the Arctic nor the Antarctic,

FOG has cut visibility to 200 feet in this photo. Fog, a killer on Mount Washington, has kept people from seeing safe huts a few hundred feet away. Air Force personnel (here) and other workers on mountain quickly learn never to go outdoors in winter without wearing full Arctic clothing. Even in midsummer, the fog can freeze into ice.

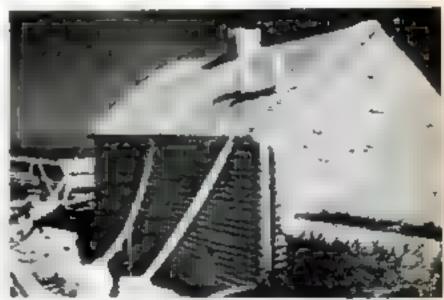

IB POPULAR SCIENCE

but Mount Washington, N.H.: As bleak a winter scene as there is anywhere and much closer to home.

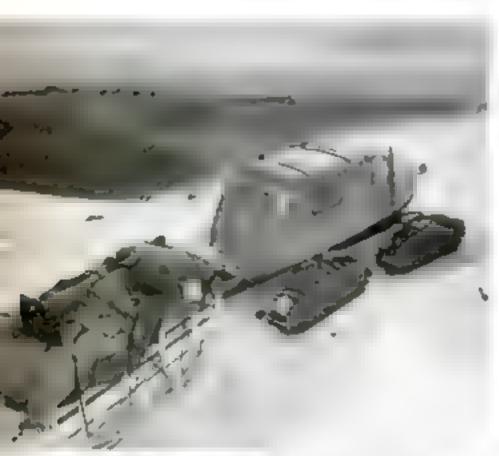

RIME-COVERED SEEP had to be abandoned on summit. Fourteen storms last winter piled up 274 inches of snow on mountain, all-time record.

CHAINS ANCHOR BUILDINGS against wind Wind often makes it colder than Antarctic, in spite of temperatures there down to minus 124 I

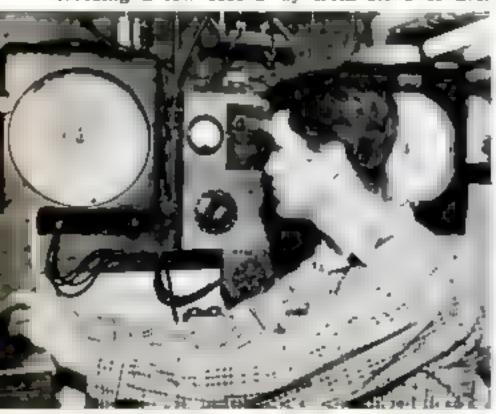

SNOW almost buries building (man is clearing window near roof). Wind after storm is as bad as the storm itself: It coats buildings (as here), cuts visibility sharply, whops up snow.

SNO CAT is only vehicle able to climb the mountain in winter after the highway and cog railway have been shut down. Ice makes it a long, dangerous creep even for tractored vehicle

BEST DUTY IS INDOORS on Mount Washington. Here observer Brook Vivian checks one of many gauges in observatory. Even indoors, it's below freezing a few feet away from stove or fire.

during which the wind averaged a furious 129 m.p.h.

You can reach the summit by car (there is a road all the way); by cog railway (which climbs one foot for every four traveled, and takes an hour and a quarter to cover 31/4 miles); or by hiking. Once atop the peak, the highest in the northeastern U.S., you're likely to encounter, even in summer, winds up to 100 m.p.h., snow, cold, and freezing fog.

Although the climb is so easy that gangs of schoolchildren march up and down each year without accidents, and a 300-pound girl once went up and back in a day, you should be warned that:

 Mount Washington is one of America's deadliest tourist attractions.

 Thirty-three people have died, many from freezing, exhaustion, or exposure, on or near its peak

 Tragedies increase as the visitors to the mountain increase. There has been a fatal accident in almost every recent year. Last July, a college graduate student and his date set out one afternoon to hike to the summit. They were not again seen alive. When their bodies were found. mountain men guessed what probably had happened to them: In light clothing, they walked out of the summer day in the valley right up into a storm of wind, cold and rain that wore them out and sapped—as Mount Washington's storms do—both their will and ability to go any farther

They were found, the boy's body trying to protect the girl, in a place where that kind of protection is impossible: on the summit cone of Washington, a bleak, rock-strewn, three-by-two-mile area, entirely exposed to gales from the Arctic. Canada and the Atlantic, a place so inhospitable to life that nothing but Alpine or Arctic shrubs can grow there.

They were less than 2,000 feet from heated buildings and safety on the very top, which they could not see, or had not

the strength to reach.

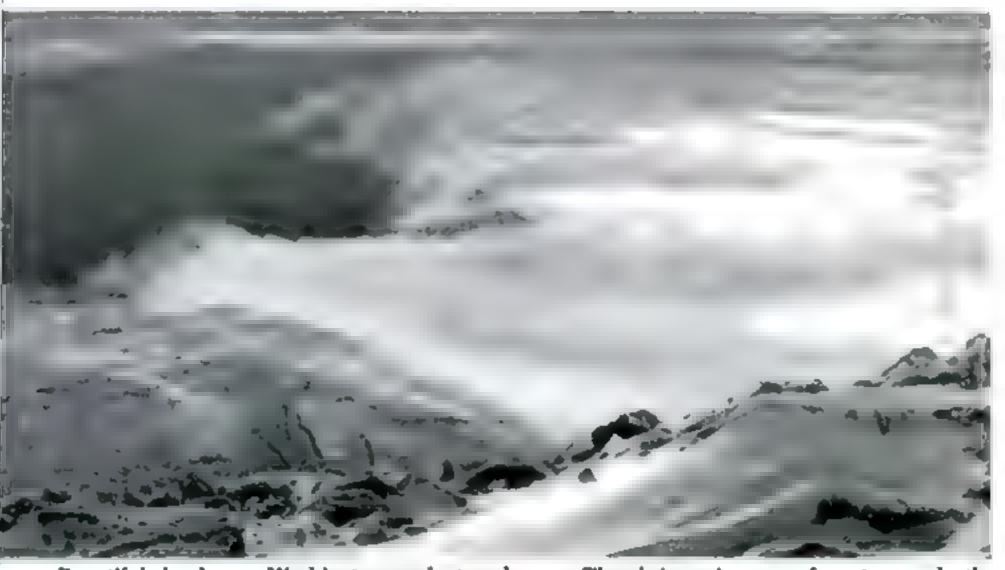

"Of all the mountains that are easily accessible to men," says Bradford Washburn, one of America's outstanding mountain clumbers, "Washington is one of the most dangerous."

Mount Washington has earned its repu-

tation for a number of reasons.

Its amount of snow. This April, when the akiers arrive for the skiing season

128 POPULAR SCIENCE

Beautiful clouds over Washington can be treacherous: They bring rain, snow, fog, storms-death.

that sometimes lasts into July, they will be out to enjoy the 200 inches of snow the mountain is known to get each winter. That's five times what Minneapolis gets. There were 274 inches in 1957-58, the most so far, and nobody knows how much snow isn't measured because it is blown away too fast. This amount of snow can be as dangerous as it can be pleasurable: It causes avalanches. In 1955, one swept down over a skier, and smothered and froze him to death.

Blowing or drifting snow, after a storm, is just as bad in Mount Washington's winds as the storm itself: Visibility is reduced; the cold, icy crystals are painful when whipped into face or ears; and a skier's or climber's tracks can be erased as quickly as they are made.

The low temperatures. Three times on Mount Washington the mercury has gone down to 46 degrees below zero; once to minus 49. This, or the more common minus 25, may not be comparable to Siberian or Antarctic records, but it can be enough to set up severe shivering and chattering—the kind it takes hours to get over once you get into a warm place.

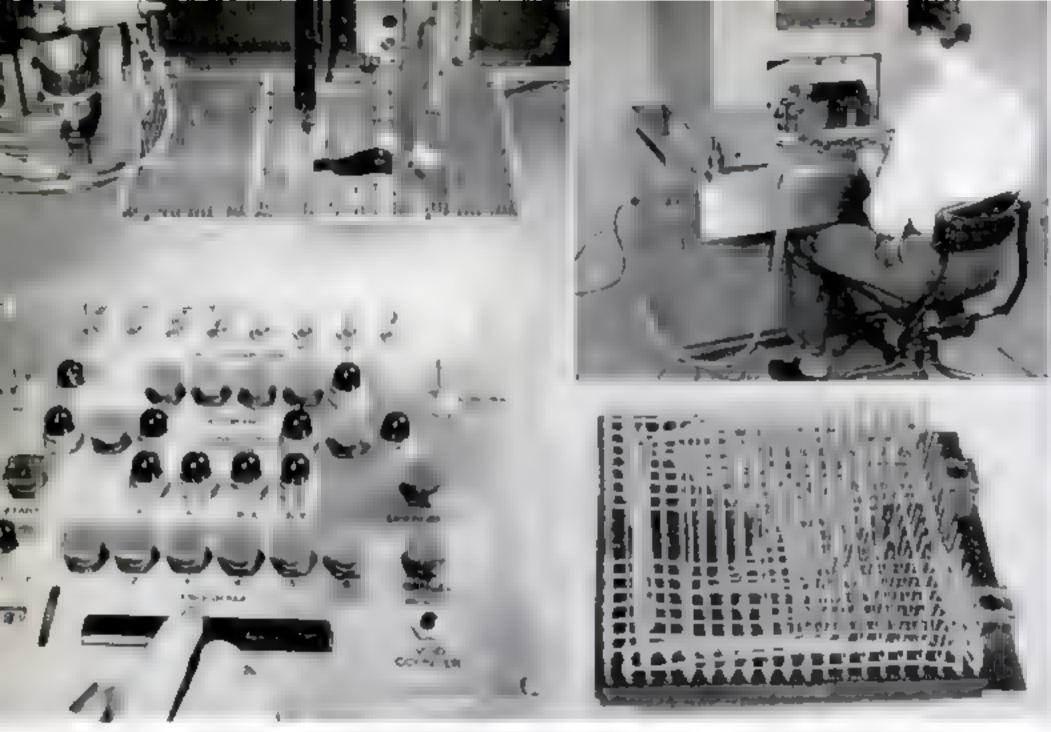

The reason Mount Washington is cold is a matter of altitude: The temperature decreases as you go up, and the rate of drop is usually about four or five degrees for each 1,000 feet you climb. Thus, if you start at around 2,000 feet high, where some trails begin, and the temperature is near freezing, on top of the mountain it will be 16 to 20 degrees colder. Sometimes the summit temperature is as much as 45 degrees below that at the base.

"No matter what time of year you climb Washington," says Fran Belcher, executive director of the Appalachian Mountain Club, "and no matter if you start out in shorts, have along clothing for winter. Wear climbing boots, wool socks, and carry a pack with long trousers, extra shirt, sweater, raincoat or parks."

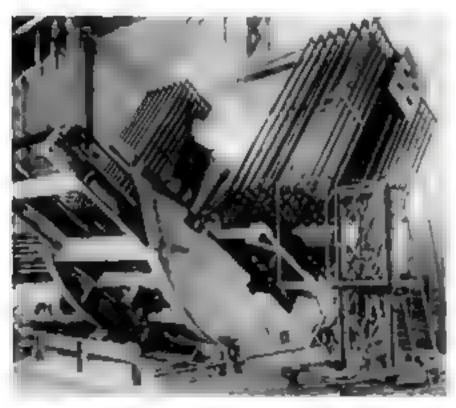

The scind. The first man known to climb Mount Washington, Darby Field in 1642, found "a great tempest of wind." On the mountain and also on the slopes, where the skiers will cavort, natives say the wind blows so hard it takes two men to hold one man's hair on.

Back in 1883, when the Signal Service had a weather station on the mountain, a Sergeant Beals went out at noon to change the cups on an anemometer. The wind first wrenched his screwdriver away. Then it unwound the scarf around his head and carried it off. When the wind removed one of his overshoes and sent it

[Continued on page 230]

NIMBLE FINGERS. This \$40,000 machine accurately wraps 10,000 wires in solderless connections on 20-inch panels (lower right) for an air communications system. Wire fed in at upper left in the keyboard closeup is transported by the carriage at right to the center dressing finger that makes connections. Gardner-Denver developed it for Hughes Aircraft.

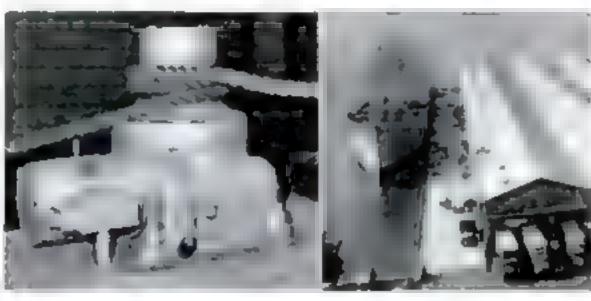

BIG ROCKING HORSE. These motor-driven rockers were devised by GE welders at Schenectady, N.Y., to rotate gigantic transformer tanks in a 90-degree arc to put them in best welding position. Cranes hoist the parts for assembly.

SUPER-LIGHT CAB. The new GMC tractor above has an all-aluminum tilt-cab, said to make it the lightest on the highways. Its front axle is set two inches back of the 48-inch-deep cab, uses a new kind of air suspension.

TANK STOPPER. A pistollike firing mechanism held by an infantryman guides the British rocket at right straight to an approaching enemy tank. The rocket, carried in its 45-pound launcher, can be set up and fired by one man. The missile is 53 inches long, has a wingspan of 12 inches. It's accurate, hits anything that can be seen.

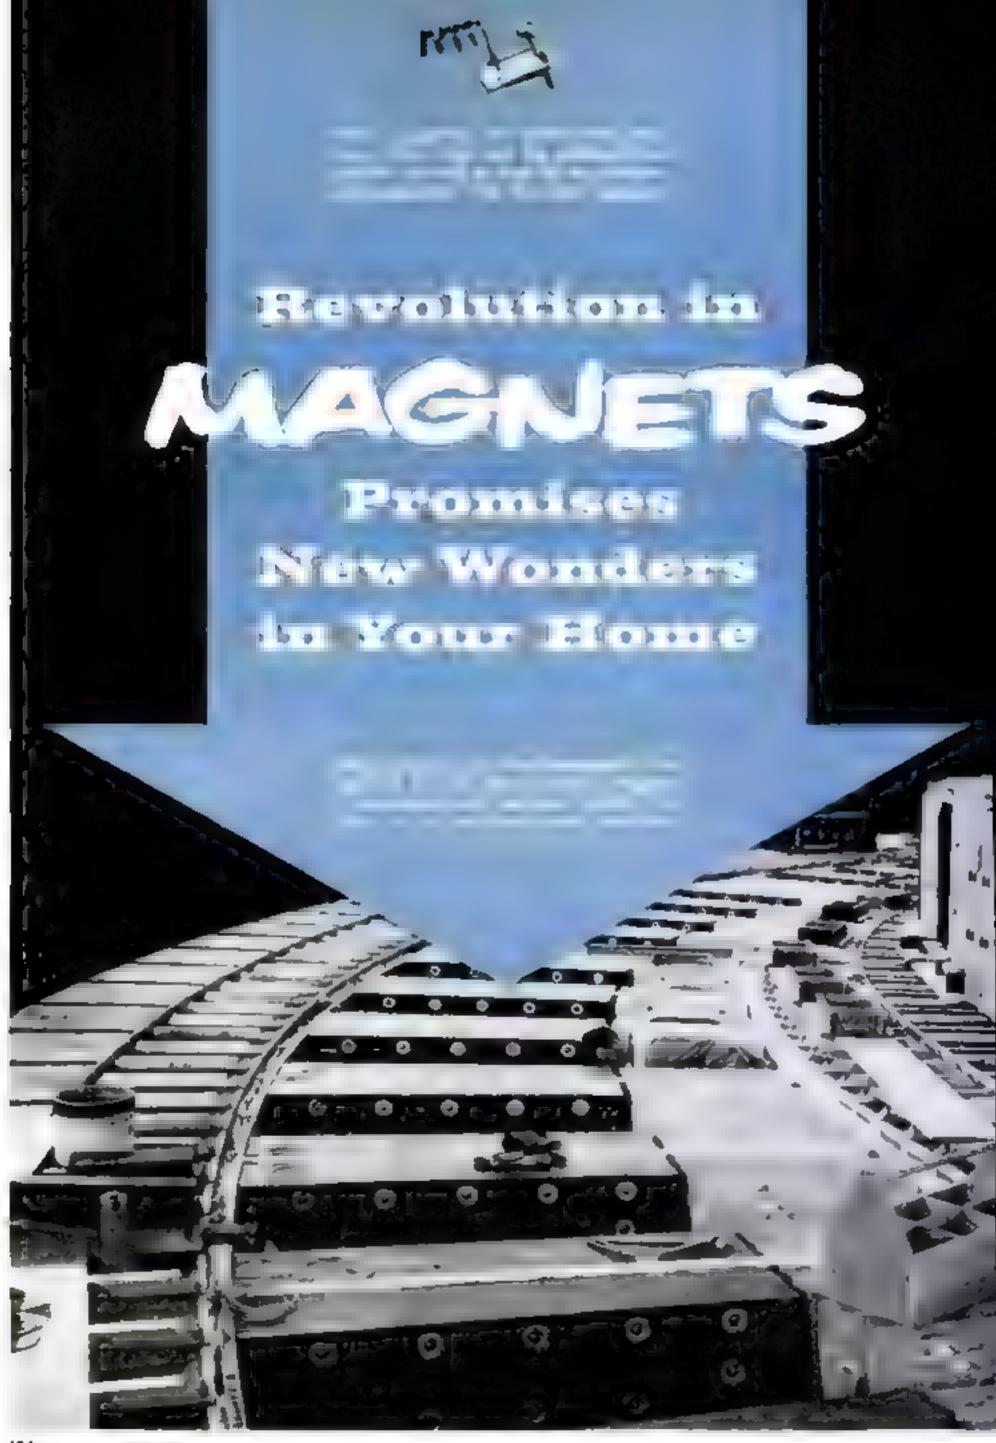

ship puller. This electric capstan (left) is one of six installed by the Port of New York Authority to warp barges and lighters around corners of a Brooklyn pier. It is run by a 10-hp motor, pulls loads up to 5.000 pounds at 45 feet a minute.

CRAB PLOW. This electric tractor, invented by a Scottish farmer, draws current from a power line and shuttles back and forth across the field, plowing first in one direction then in the other. It operates on a 30-hp, motor fed through a 500-yard cable and driving a pump that powers individual hydraulic motors in the two big wheels above. An outrigger wheel (right) acts as a stabilizer.

Why is iron magnetic? Solving this ancient puzzle pays off in stronger and better magnets

By Martin Mann

A BREAKTHROUGH like this makes you think about turning things upside down."

Thomas Paine, perched on the desk in his laboratory, was talking about magnets: the remarkably powerful and versatile permanent magnets that General Electric has cooked up from iron powder finer than cigarette smoke.

The things that ex-submariner Paine was thinking about turning upside down were some of the most ordinary contraptions in your life—small motors, pants fasteners, machine bearings, loudspeakers for TV and hi-fi—as well as some very unordinary ones:

 Magnetic sponge-rubber weatherstripping. It would stick wherever you pressed it around a car-door frame.

 Magnetic storm windows. With magnetic weatherstripping edging a sheet of clear plastic, it would stick airtight to a steel window frame. Come summer you could pull it off, roll it up and put it away.

 Very small yet very efficient DC motors, their rotors permanent magnets instead of wire-wound electromagnets.

• Inside-out loudspeakers. Now speakers have heavy permanent magnets fixed solid to the end, while light electromagnetic coils attached to the paper cones make the cones vibrate. It might work better if the coil were fixed, motionless, with the permanent magnet built into the vibrating cone. The whole cone could be the magnet—thin plastic impregnated with fine magnetic powder.

Magnetic zippers, Plastic or cloth

MAGNET MAKER: GE's Dr. Thomas O. Paine checks pull of remarkable new permanent magnet he and associates developed. It can be 10 times as powerful as strongest now in use.

impregnated with tiny magnets would make good clothes fasteners—fumble-proof and jamproof (but you'd have to watch out when walking near a big electric motor).

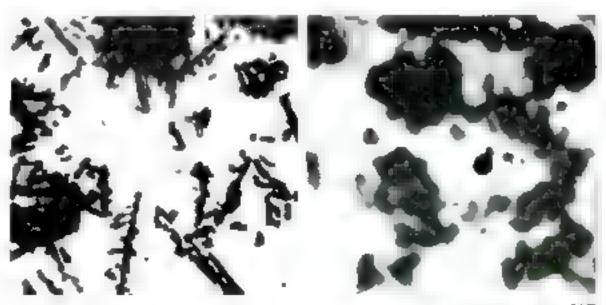

• Magnetic bearings, Electric meters already have them. The spinning aluminum disk floats in air, its support an invisible magnetic field induced by a magnet that never touches it. Stronger magnets could float bigger parts—clock gears, for instance.

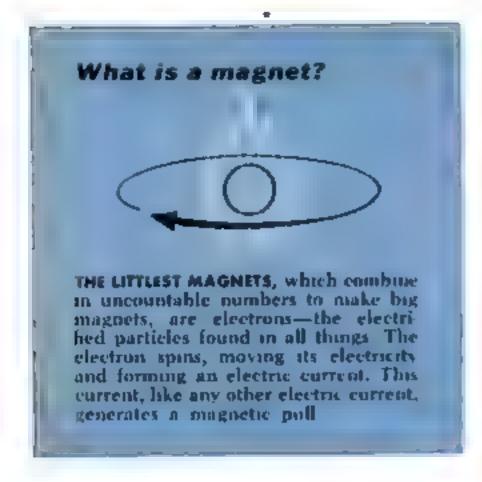

And there's more to come. For Paine's new magnets are unlike any ever made.

For one thing, they are extremely powerful. The ones that GE is now producing in pilot quantities are as strong as the strongest now manufactured. Potentially, they could be 10 times better.

But more important is their versatility. Magnets have always been heavy, hard

FINER THAN CIGARETTE SMOKE: Microscope shows ultrafine iron particles (near right, compared to eigarette-smoke particles at far right) that give new permanent magnets tremendous strength. Magnet is made by mixing particles with binder and then molding. This gives magnets of almost any shape.

and brittle, adaptable to only a few shapes. Not these. They can take on almost any form you want: hard and tough metal; soft, flexible rubber; light plastic; even transparent glass. You can bend them, cast them, drill and machine them.

The reason for this adaptability is that the magnetic part is pure iron powder, each particle so tiny that it can be seen only with an electron microscope. To make this fairy dust into usable magnets, you mix it with a binder. The binder can be anything: rubber, glass, plastic.

Actually, these iron-powder permanent magnets are just one gain from a more fundamental breakthrough—a new and thorough understanding of magnets and what makes them work. This new knowledge will change the way you live as dramatically as the discovery of electromagnetism a century and a half ago. It can bring new communication systems, better ways to drive cars, planes and spaceships, practical schemes for supplying power without wires. It could reveal the long-sought link between magnetism and gravity.

Magnets, magnets. You don't often see them, and when you do, they don't look like much, yet magnets make the world's wheels go round. There are puny permanent magnets with just enough pull to hold onto a can lid, and there are the fantastic electromagnets for scientists' atom-smashers, 10,000 tons of expensive steel and hundreds of miles of copper wire, powerful enough to pop spikes out of a plank.

Mostly, magnets—as electromagnets—are electrical machinery. They generate electricity in the powerhouse. They seesaw amperes and volts up and down in transformers to put electricity to work.

You probably have somewhere around 75 magnets in your house. (Count 'em: three or four in the washer, as many or more in the hi-fi, two on the door chime, eight in the TV set, and on and on.)

U.S. production of permanent magnets runs close to 200,000,000 in a year, with 40,000,000 marked for TV alone.

And, of course, magnets aren't new. The philosophers of ancient Greece pondered the strange behavior of lodestones (natural permanent magnets) from the province of Magnesia, whence the name Columbus and his friends made brilliant use of them in the compass—to find the New World.

But in all those thousands of years no one understood the how or why. To-day scientists do. They can explain magneta—the things that produce magnetic force. When it comes to the force itself—magnetism—the fog of ignorance settles once more.

Inside magnets. How come some iron pulls at other iron, silently, tenaciously, timelessly? How come different iron acquires this power only when electricity travels in a wire around it, reverses its pull when the electricity reverses, loses its pull when the electricity stops? And why only iron (there are other magnetic materials, too, but not many)?

The answers came as acientists pried

ATOM-MAGNETS BALANCE, TOO, within most materials, with just as many
pointing one way as the other. So
again, their pulls cancel out, and no
useful magnetic force results.

deeper inside metal atoms with the new and sharper tools of quantum theory. They found a gem: a beautiful example of the majestic simplicity with which Nature orders her universe. This is it:

All magnetism—permanent or temporary—comes from electricity. Any electric current generates a force that goes by the name magnetism. Everything in the world contains electric currents—spinning electrons inside its atoms. Each spinning electron is a magnet. For this basic magnetism to make itself felt in a usable piece of metal—which will contain an unimaginable horde of electrons—three things must happen:

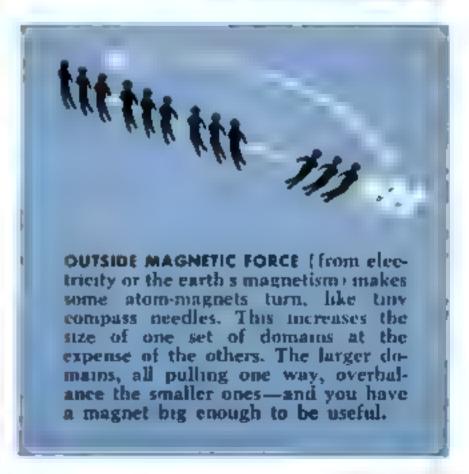

1. The spinning electrons in each atom must line up so that more point one way than the other. Otherwise the electrons' magnetism cancels out.

 The atoms must line up in groups called domains, otherwise the atoms' magnetism cancels out. Domains are big enough to be seen with a microscope.

3. The domains must line up so that most of them point in one direction, otherwise their magnetism cancels out.

Only iron (and nickel, cobalt and a few other relatives) meet the first two requirements naturally. The theory shows how a few other materials can be forced to meet them, and has led to a good permanent magnet made of manganese and bismuth, both elements which normally are not magnetic.

Permanent magnets have domains that are difficult to line up, but once lined up EXCEPT IRON (and relatives): These few elements have atom-magnets that line up in groups called domains, forming magnets big enough to be seen with a microscope. But again, the magnetic pull usually cancels out in higger pieces of material: The domains pulling one way are just as big as the domains pulling the other way.

STEEL TANKS AFLOAT. Standard tank units, called Uniflotes by their British maker, can be assembled to form a landing dock (top), a ferry (left) or bridge supports (right). Aligned by pulleys, the sections are held together with hooked lugs under water, locking pins at deck level.

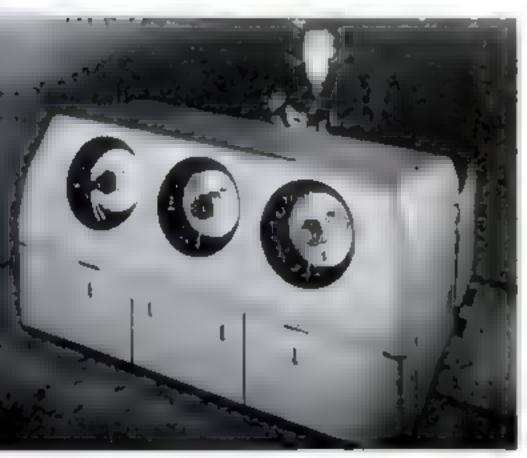

EAR ALARM. When your head nods if you doze off while driving, a pellet of mercury in this device levels, closes a circuit, buzzes in your ear. A battery powers the Driver-Larm, made by Wright Airborne Electronics, Kansas City, Mo.

GOOSENECK HITCH. Tractor and semitrailer can clear turns up to 110 degrees with this linkage made by Steel Fabricators, Wales. The hitch also suspends the load below and ahead of the rear axle, giving drive wheels more grip.

NIGHT-LIGHT TENNIS. Fluorescent floodlighting at the Tueson, Ariz, Racquet Club is believed to be the world's first. Twelve units are suspended from two 125-foot-long cubies 25 feet above the courts. "Far better than conventional lighting" says Australia's ace Adrian Quist.

BIG COLOR TV. Three projectors, one for each primary color, threw nine-by-12-foot pictures on a screen at a recent closed-circuit presentation before a Minneapolis medical meeting. North American Philips developed the equipment.

NEUTRON DETECTIVE. Dwarfed here by a fingernail, a millionth of an ounce of uranium on a slice of germanium is used by Westinghouse in tight corners of reactor cores. It maps patterns created by neutron pulses from split atoms.

New jobs for flashlight cells include everything from polishing shoes to playing records. Coming soon—truly portable TV sets

Clever New Gadgets Run on Flashlight Batteries

By Howard G. McEntee

OU tell the clerk you'd like a couple of "large-size flashlight batteries." He asks what for. You suppress an urge to tell him it's none of his business, but he's right—it's very much his business.

A lot has happened since the days when flashlight batteries were used for flashlights. Today's big boom in battery power has been made possible by an amazing new assortment of pint-sized power plants, all of which look like flashlight batteries but do remarkably different jobs.

Today, you can shave by battery, listen to records by battery, mix cocktails by battery. You can power radios, movie cameras, dictating machines, Geiger counters, fire and burglar alarms, tape recorders, clocks, kitchen food mixere—all without plugging in an electric cord.

In the wonderful world of the future are such bright promises as batteryrun power tools, truly portable TV sets and a variety of cordless home appliances.

Most of these run on flashlight batteries in name only. Big makers like Burgess, Eveready and Ray-O-Vac produce flashlight-like batteries in a dozen types and sizes. As Eveready says: "We even make flashlight batteries for flashlights."

Don't laugh, though. There are at least three different kinds of batteries that you can put in your flashlight, depending on how you want to use it. Picking the right battery for the job is more important than ever because there are so many more types to choose from. For instance:

 The wrong cell in a portable radio may put an untimely end to your favorite program.

• The wrong cell in your flashgun may work for a while, then fail to fire just when you're set for that perfect shot.

 Junior's toy that fizzled out the day after Christmas can be given a longerlasting lease on life if you know how to buy more powerful batteries.

Be your own expert. You can't always count on the clerk at the corner store to guide you through the maze of modern packaged power. Some of the many new types are available only at special stores, such as radio or photo-supply shops. Often the battery that came with a device is a poor guide, since it may represent the cheapest, not the best.

Some portable radios take either ordinary batteries, which must be replaced

SIX-POUND PORTABLE PHONOGRAPH, above, plays 6,000 times on one set of four ordinary flashinght cells, or can also use heavy-duty bat-

teries for longer life. Made by Tri-Phi, Inc., of Albertson, N. Y., the three-speed, transistorized record player will sell for about \$50.

frequently, or rechargeable cells that are renewed when you plug the set into a 115 velt house outlet. One frees you from replacing dead batteries, the other frees you from dependence—even partial—on a power cord. You have to decide which is handier for you

What is a "flashlight" battery? Bat-

teries of the "flashlight" type have two
things in common:

- All, regardless of size, are designed to produce a nominal voltage of 15 actual voltage may be slightly less and tends to drop faster in smaller sizes).
- Nearly all are of the classic carbon zinc construction. You'll hear other

How to tell the many sizes of flashlight cells apart

BATTERIES SHOWN ACTUAL SIZE below are each identified by letters which do not always appear on the battery itself. If you're not sure which size you need, match an old cell to one of these shapes.

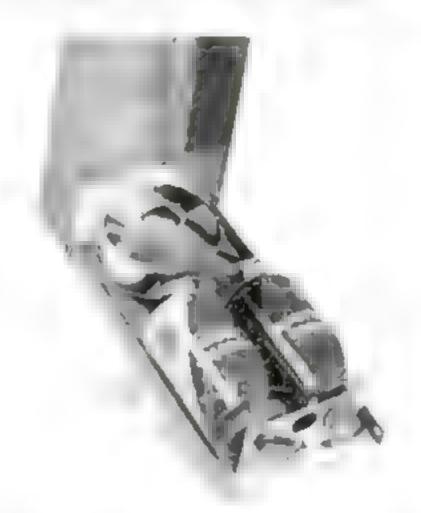

cordiess shavers let you spruce up any time, anywhere. Swiss-made Lord Rusm at left uses two D cells, is sold by Belf & Lustig, Elmhurst, N. Y., for about \$13, Slim Universal model at center for about \$17 runs on four AA penlites. Noreleo at right (about \$25) has a separate battery case holding three D cells, also runs on power from a six- or 12-volt ear battery.

inexpensive home fire alarm lets out a loud howl if temperature rises above 135 degrees. It's sold by Merlite Industries, NYC, for \$4.95, will last a year or more on a pair of D cells.

strange names—alkaline, mercury, nickelcadmium—but most of these batteries are made to supply different voltages and are not considered in the flashlight class, though some of them do come in flashlight sizes.

Unecrambling the sizes. Luckily for the buyer, battery makers and the National Bureau of Standards have cooperated in establishing five basic sizes of flashlight cells, "D" cells are the large, familiar "standard" size—about 1½" in diameter and 2½" tall. Next smaller are the ones that bring a smile to the clerk's face when they're described as "sortalike a flashlight battery but kinda smaller." These are "C" cells—about ½" by 1½"—and are used in small flashlights, lightweight flashguns and many toys.

Don't, however, confuse battery size with battery type. All makers use the same letter markings to designate size, but each one uses a different number to designate type. You may have little choice in the size of battery you need if it has to fit in a given space, but you have a lot of choice in the type you pick:

Finshlight cells for flashlights are just that. Called general-purpose batteries, they're intended to give good service under the light, few-minutes-on, many-hours-off kind of duty that is typical of flashlights. But hook one up to a heavy-drain appliance, such as one that has a motor in it, and you may run it down in half an hour. This is why many battery-powered toys go dead after only a few hours' use.

Industrial flashlight cells are heavierduty versions of the general-purpose type, but they are still designed for the same intermittent duty rather than for continuous heavy drain.

Eveready compares its industrial No. 1050 cell with its general-purpose No. 950 cell like this: With a load of .3 amps (comparable to an industrial flashlight bulb) applied intermittently to each one for a total of two hours a day, the industrial cell gave 13 hours of service, the general-purpose one six hours.

Should you use industrial cells in your own flashlight? Only if you depend on them for constant use every day. Otherwise, they're likely to die of natural causes before you get full value.

Photoflash cells are a different breed entirely. They're designed to give the large amounts of current required to fire a flashbulb, but only in short bursts a

fraction of a second at a time.

Ordinary batteries will fire a bulb, but may not reach full power output fast enough to fire it at the exact instant required to synchronize properly with the shutter. The reason? Flashlight cells have a peak current of six to eight amps, photoflash cells up to twice that. But don't use photoflash cells in your flashlight or radio—they'll do very poorly.

Radio batteries, unlike those for intermittent or instantaneous duty, are made especially for portable radios and other devices that may be run several hours a

day, day in and day out,

Two types are available, and here the pick is important: Cells for conventional tube-type portables are made to withstand the moderately heavy current drain of the filament-heating circuit.

Cells for transistor portables are similar, but are made to last much longer

YOU CAN MIX COCKTAILS and other drinks away from home on two D cells in the mixer above. It's sold by Sibert Mfg. Co., Newark, N. J., for about \$10. Batteries last several months.

TYPE OF BATTERY	SIZE	APPROX.1 PRICE (cents)	MATCHING CELLS OF FOUR BRANDS				
			Bright Star	Burgess	Ever- eady	Ray 0 Vac	USES

	D C AA	25 20 15	10MC 11P 59P	2R 130 930	D99 635 1015	51 P 11 P 7 R or 7 L P	Tube radios; motor- dr ven devices hearing a ds, and other heavy drain uses
	D	20				6LP 10LP	Sold mainly for toys and novelties
VERY REAVY DUTY (alkaline cell)	D 1/2D	75 50			E95 E94		Frashguns, motor- driven, other heavy continuous drain use

NEW COMPACT ELECTRONIC FLASHGUNS run on three D-size cells stored right in the handle, eliminating both flashbulbs and separate power packs. You can use conventional photoflash batteries at left (25 cents apiece for about 200 flashes), high-power Eveready 195s at center (75 cents apiece for about 500 flashes), or reclargeable cells at right (about \$5 apiece) that last for years. The Heiland flashgun shown selfs for about 500, can also run on 115-volt house current when used for indoor shots.

PORTABLE BARBECUE SPIT has a tiny six r p m. motor that screws onto a two-cell flashinght—which also serves as a flashinght. The spit, complete with flashlight, is sold by L R K of California, Redwood City, Cal., for about \$10.

under a lower current drain. Burgess, for instance, says their No. 2R cell for tube radios will last 90 hours when drained at 60 ma, for four hours a day, while their special No. 230 cell for transistor portables, drained at only 20 ma., will last up to 525 hours

Some radios come from the factory equipped with "ordinary" flashlight cells For an extra nickel, it will pay you to switch to the correct type of radio cells you won't replace them as often

Radio-type cells are also good buys for many other continuous-duty devices hattery-powered clocks, movie cameras, projectors, tape recorders, electric shavers, Geiger counters, portable phonographs and toys with motors

The accommoning chart lists equivalent battery types of four widely sold brands to help you in making a choice Because of differences in manufacturing, not all of these are exact duplicates, but they will serve as a rough guide

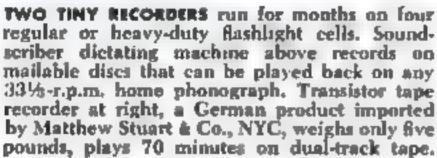

One super-heavy-duty cell has just been added to the list. This is Eveready's D-size E95 (also available in a new ½-D size, called E94). Although an alkaline cell, rather than conventional carbon zinc, it is designed to be interchangeable with other 1.5-volt flashlight batteries.

The little E95s are both spectacular and expensive. They withstand heavy abuse under either intermittent or con-

coming soon are BATTERY-RUN TV SETS like this midget 10-pound GE portable. Motorola is also planning a similar set for sale early next year that will run on as own batteries, your car battery or on 115-yell house current

tinuous drain. In certain jobs, they last up to 10 times longer than ordinary cells. And they perform at temperatures from 40 degrees below zero to 200 above, while other batteries are of little use below zero or above 130.

But at 75 cents apiece, they cost three times as much as other batteries. You may find them useful if you count on a flashgun to work in sub-zero weather or for very heavily used radios and appliances that eat a lot of canned juice. For general duty, the E95s are still luxury power.

Batteries are better than ever. Remember when you used to look for a stamped date on every battery to be sure it was fresh? Remember when you paid extra for a so-called "leakproof" type?

able radios give you a choice: Special D cell at right lasts well but needs daily charging on house current. Away from home, you can run set on four penlite cells in plastic case at left.

Modern batteries last so much longer than their elder brothers that dating is no longer necessary. Thicker walls and special sealing tricks also make nearly all batteries virtually leakproof.

Ray-O-Vac's "sealed-in-steel" container prevents corrosive chemicals from spewing out even if they eat through the inner zinc container. Burgess adds a "chrome inhibitor" that slows down deterioration when a cell stands idle. Eveready uses a unique "inside-out" construction for its special-purpose D-size cells. Instead of putting the easily eaten zinc on the outside with the carbon electrode in the middle, it puts the zinc in the middle with an outer casing of carbon that can't corrode.

trend toward easily obtainable cells is seen in camper's lantern sold by Ray-O-Vac. If special six-volt lantern battery is not available, light will run on eight ordinary flushlight cells that can be bought anywhere.

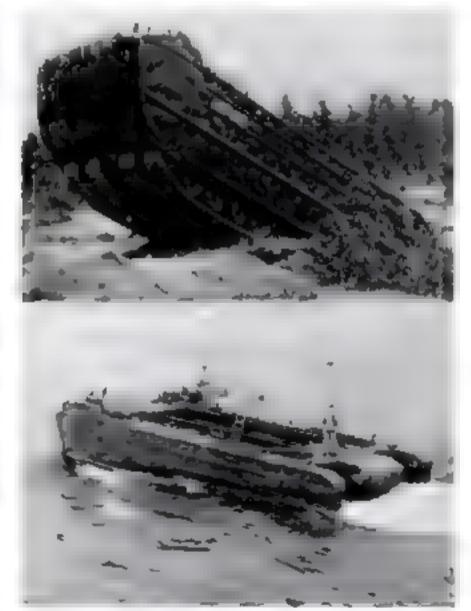

HIGH-HAT TRAMP. The cargo ship Weybridge is a sailor's dream, and has even borrowed seaworthy features from several fish. There is a private, air-conditioned cabin for each crew member. Above is the chief engineer's day room, and next to it the navigator's lounge. And, of course, there's a deck swimming pool for all. Edmund Watts, chairman of the

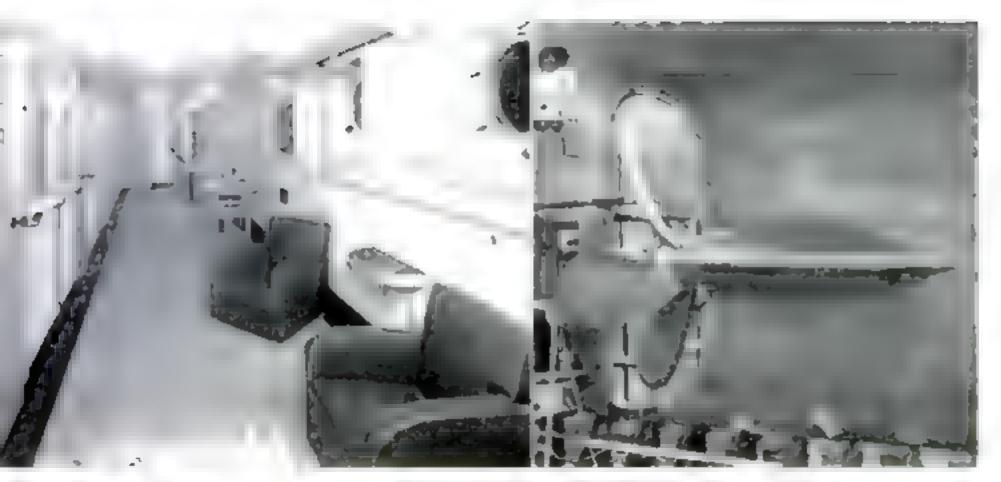

TURNTABLE LAB. When these students have finished an experiment, the flick of a switch rotates another laboratory setup into position. The unit was designed by two University of Illinois physics professors for small colleges.

BY LAND OR BY SEA. Goliath is the Navy's newest amphibian. On four tracks it can haul 100 tons over land at 13 m.p.h. Two retractable propellers plow it through water at seven m.p.h. Twin 500-hp. engines power the vehicle.

136 POPULAR SCIENCE

Britain Steamship Co., for which the 487-foot, 10,500-ton ship was built, is a student of the swimming habits of fish. The flap (far right) just forward of the propeller, adapted from the blue tuna, creates water turbulence which, he says, adds a half knot to speed, saves fuel. From the salmon come bow "shoulders" that throw heavy seas away from the ship.

KEYBOARD FLUTE. Holes are replaced by piano-like keys on the Melodica (below), which was recently introduced in West Germany. The manufacturer, Hohner, claims that this unusual arrangement makes the musical instrument easier to play.

CROP-DUSTING ATOMIZER. A winddriven fan behind the can (top photo) forces liquid chemicals through a screen, creating a mist. Less than half the usual amount of chemicals per acre is needed with this British dusting plane.

What's New

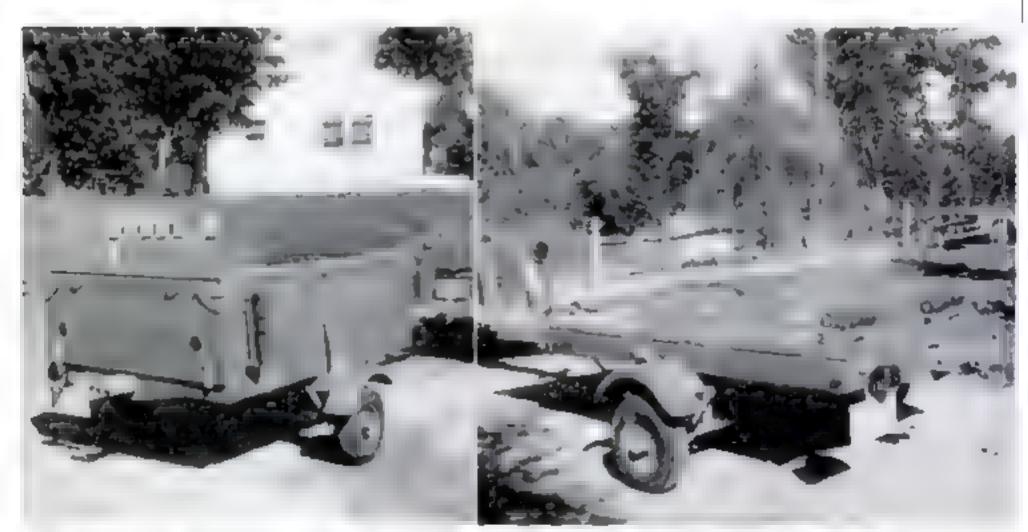

for the family car

BLAST OFF carbon-fouled spark plugs with a jet stream of carborundum grit. Distributed by Sports Car Entrepreneurs, the plug cleaner works on air supplied by a hand or foot pump, or compressor.

Can't bear to leave the TV set? Take it with you to the woods, mountains or beach and plug it into a \$42.50 (and up) inverter that plugs into the cigarette-lighter receptacle. It turns six- or 12-volt battery power into 120-volt AC current. American Television and Radio Co. makes it to operate a tape recorder, dictating machine, shaver, and drink mixer as well as the TV set . . . Two-and-a-half ounces of a fine powder made by U. S. Rubber Co. poured into each tubeless tire may save you a roadside flat. The powder plugs a puncture that otherwise would quickly lose air, enabling you to drive hundreds of miles to a service station. The light powder doesn't affect wheel balance.

Owners of foreign cars held together with metric bolts can tinker away with an 11-piece metric socket set at \$9.95 or a 15-piece set at \$19.95 made by Penens Tool Corp. . . . Serious engine tuners will find a useful tool in a proximity tachometer fitted with a range switch and multiple scale for measuring the r p.m. of two- and four-cycle engines having one to 12 cylinders. A single lead is simply placed beside the high-tension wire at the coil. Fox Valley Instrument Co, sells it for \$72.50.

YOU BUILD THIS ALL-YEAR TRAILER on a basic trailer chassis made by Montgomery Ward. Detailed plans sold by Outdoor Industries for \$4.95 show how to make and assemble the parts on the chassis. With sides up (above left), the

trailer is an all-purpose utility or camping rig. In seconds, the tailgate can be removed and the front gate and sides folded flat as shown at right, putting adjustable rubber rollers in position for hauling a boat.

DRIVE-ON CAR RAMPS made of welded steel angle provide clearance for home lubrication

and maintenance A stop bar prevents over-run. Pedozzi International distributes the ramps.

for your home

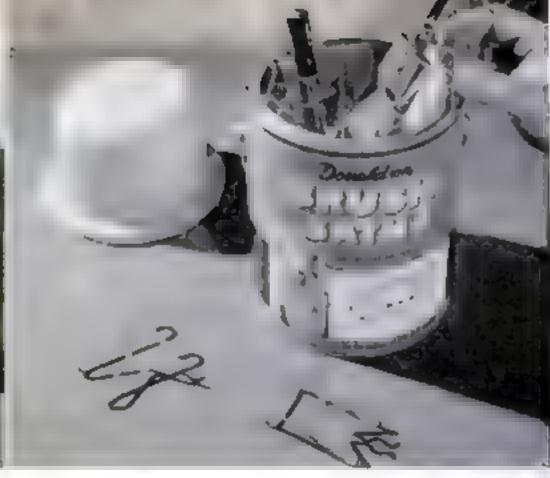

Painting this spring? You'll find many painting aids in hardware stores to speed the job and make it easier. A 98¢ guide that clips to the side of a brush will help produce an even line around doors, windows and trim. The guide swings out of the way when the brush is dipped. Kurdon, Inc., makes it for brushes 2" to 4" wide.

A new Ladder Caddy clamps to any ladder to hold a gallon of paint, brushes, and wire brush securely within arms reach. Deejay Mfg. sells it for \$6.95... A safety ladder made by Novel Products has an extension frame that braces you while you stand on the broad top step—you'll feel as though you're on a balcony. All aluminum, it's made in 5', 6' and 7' lengths at \$10.95, \$13.95 and \$16.95... For those who don't like ladders, Pittsburgh Plate is selling a 9" roller with shielded bearings for easy rolling and an extension pole

NO MORE SCRAPING AND CEMENTING with a new Kodak movie-splicing outfit. The \$13.90 Presstape splicer makes an overlapping cut in 8- or 16-mm, film and pressure-sensitive tape is then applied to both sides to join the film.

MORE PAINTING AIDS include auxiliary tops for point cans. The light-colored tops are made by Western Mineral Products to raise the level of quart and gallon cans for adding color or thinner without slopping over. The other tops by kay Enterprises have a spout for easy pouring and a built-in magnet to hold a brush suspended by

its metal fercile. Sun Plastie makes a similar type, not shown? Prices range from 196 to \$1.19 for the gallon-can size with a magnet. After painting, you can store brushes in a Donaldson Brush Bath (right). Wire clips daugle them in a solvent that keeps bristles soft. A vinyl cover seals the can with brushes in it.

the LUXURY OF LEATHER can be had on walls and floors for about \$1.25 a square foot with new Pigs-kin tiles made by kiefer Tanning Co. The tiles are made of genuine pigskin leather and are cemented in place. Light waxing helps retain their smooth feel and mellow color.

for easy reaching You can paint the ceiling while standing on the floor.

Before you make repairs on the lawn this spring. consider installing an underground sprinkler system. A 1,200-square-foot starter set from Everhot Products costs \$39.95, and because it's a self-draining system of polyethylene pipe, you need set it only 4" beneath the surface. Spray heads pop up when water is turned on . . . Also in the plumbing department: a set of 98¢ dials to install behind tub and shower faucets for adjusting water to just-right temperature. There's no thermostat; just remember the numbers on the dials when you enjoy a comfortable shower and next time turn the faucets to the same numbers. Order dials direct from Howard Stevens . . . A plastic patch, called Platch, is said to mend anything. To use it as a glue, or to fill in car-body dents, smashed boat hulls or concrete steps, mix an ounce of Humphrey-Wilkinson's Platch with just two drops of hardener. After 30 minutes it can be sanded, sawed, drilled and painted . . . Latest aid for playing ping pong in cramped quarters is a table that not only folds in half, but rolls easily out of the way on its own casters. Made by Haldeman-Homme Co., the table is locked against rolling in use.

Tie Spacers. Hydraulically controlled tongs of these Pullman-Standard machines grip replacement ties, or ones to be respaced, and align them at right angles to rails. Then with powerful electromagnets gripping the rails, the four-ton rigs pull themselves for ward the required spacing distance, tugging the ties with them

New Ways to Run Railroads

Push-Pull Train. Diesel-powered suburban train on the Chicago and North Western will run without turn-arounds or car switching. Chicago-bound, the locomotive will push its train, operated from controls in the car that would normally be at the rear. Out-bound movements will be conventional. With the locomotive placed this way, unneeded cars can be left on terminal tracks

Morning: Full-length train runs backward to Chicago, engine pushing. Evening: It runs out forward

Off-peak hours: Leaving some cars at the terminal, the train makes several "pull-push" shuttle runs,

Atomic Car Weighing. Gamma ravs from a lead-shielded box between the rails penetrate cars passing over this New York

Central "scale" track. Amount absorbed is measured by an overhead counter. Computer then figures payload weight.

Ambutance for Alaska. To get closer to more places, this unit can travel on both road and rail. The hydraulically operated guide wheels supplied by Fairmont Railway Motors have rubber treads

Pint-Size Diesel. Only half the weight of many 600-hp. American switchers, this new General Motors midget develops 800 hp. It's designed for use on small lines in South America, Asia and Africa

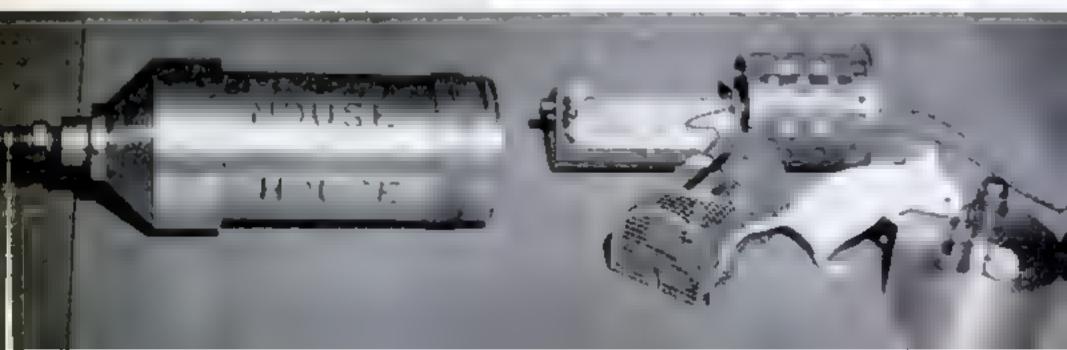

GAS A LA CARTE. This rolling filling station pumps two grades of gasoline, dispenses oil, free air, battery and radiator water. It was built by American Petrofina for a shopping-center parking lot in an Oklahoma City suburb Pumps and compressor run on a battery-operated 2½-hp, motor

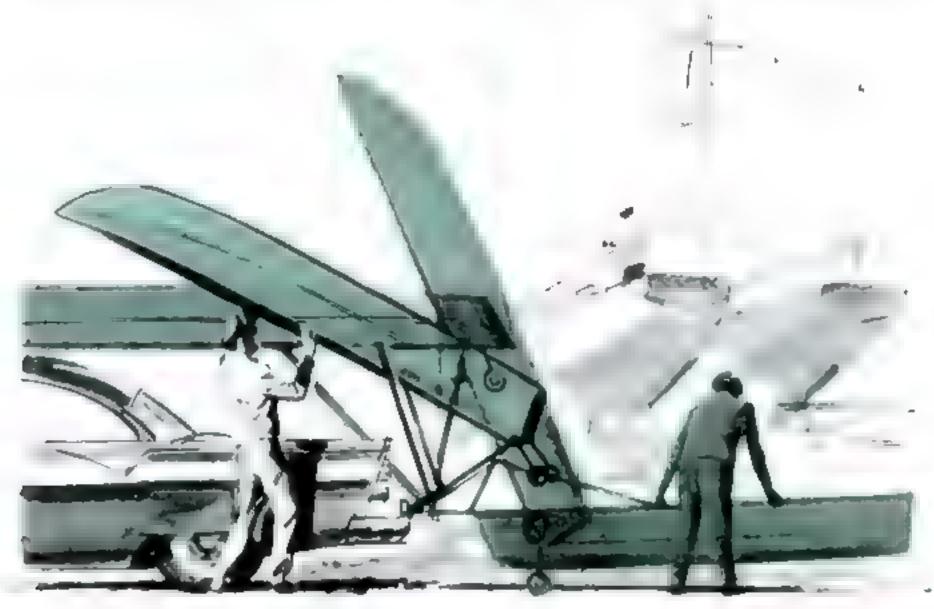

SKY WAGON. Army Ordnance is testing the new personnel carrier at right. It is built like the current M-59 steel carrier but is made of aluminum, light enough to be air-lifted and parachuted quickly into troubled areas. It will carry a squad of infantry over rough or muddy ground. Here it is shown taking a ditch on a test track at San Jose, Cal.

SPACE MOUSE. The mouse Benji below examines part of a capsule that later carried him 5,000 miles in the nose cone of a Thor-Able missile. Telemetered tests conducted by Space Technology Laboratories for the Air Force showed no ill effects. His cage and cradle are behind him

New Ideas from the Inventors

1 Carrier Helps Lift Boat. Using this recently patented device, one man could swing a boat on or off a car roof. Pivoted arms, hooked to the bumper and

oar locks, would form a fulcrum around which even a large boat could be levered up and over. Wheels on lever arms would help in maneuvering to or from the car.

2 Soldering Iron Strips Wires. Most electric and electronic hookup jobs would go faster if you had a V-notched insulation stripper looped over the tip of your soldering iron. Heated by the iron, the stripper's claws would soften and sever most types of insulation.

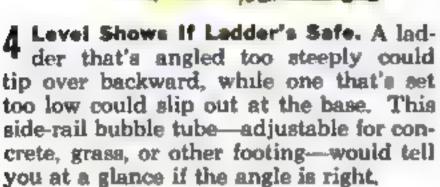

3 Magnetic Stop Holds Door. An iron or steel button and a meeting, magnet-tipped door stop would keep an open door from chattering or being swung shut by drafts. To cushion and silence metal-to-metal impact, a spring would be built into the door-button half of this unit.

Please turn the page for more new ideas

6 Weather Adjusts Road Signs. Temporary speed limits and warnings would be posted automatically by this electronic a highway monitor. Light meters, moisture

5 Fanciful Needle Diverts Child. The sight of a hypodermic is often worse than its bite, believes one physician. He'd disguise his needles with rubber hoods shaped to distract young patients. The needle might hurt less, too, because of the hood's "secondary pressure" on the skin.

gauges, thermometers, traffic counters, and other sensing devices would feed data to an integrator circuit which would then light up appropriate sections of the sign.

46 POPULAR SCIENCE

7 Tilt Light Shows Clock. You'd do less groping when you wanted to tell time in the dark if you had a flashlight like this built into—or clipped onto—your bedside clock. A tip-switch in the battery-operated light would turn on when you tilted it slightly forward.

B Glass Case Cleans Glasses. You could wipe extra visibility into your spectacles before you put them on if you carried them in a case like this. Wiping pads and knobs would be set into the sides of the stiff, envelope-like holder; the pads would cushion the lenses while they were being carried, then wipe them clean when you moved or twisted the knobs.

Gaink Washen Itself. Splash-free sink cleaning would be quicker and simpler if you could flow water around the upper rim of the basin and down the sides. This GM patent also covers a selector control for mixing hot and cold water and routing it to the faucets, the rinse ring, or a conventional spray.

MARCH 1959 149

ORIPPED AND FLIPPED, cars roll over and pour out their loads onto a conveyor belt. Winch-

powered cables clamp jaws over the cars' sides, holding the cars firmly against the track.

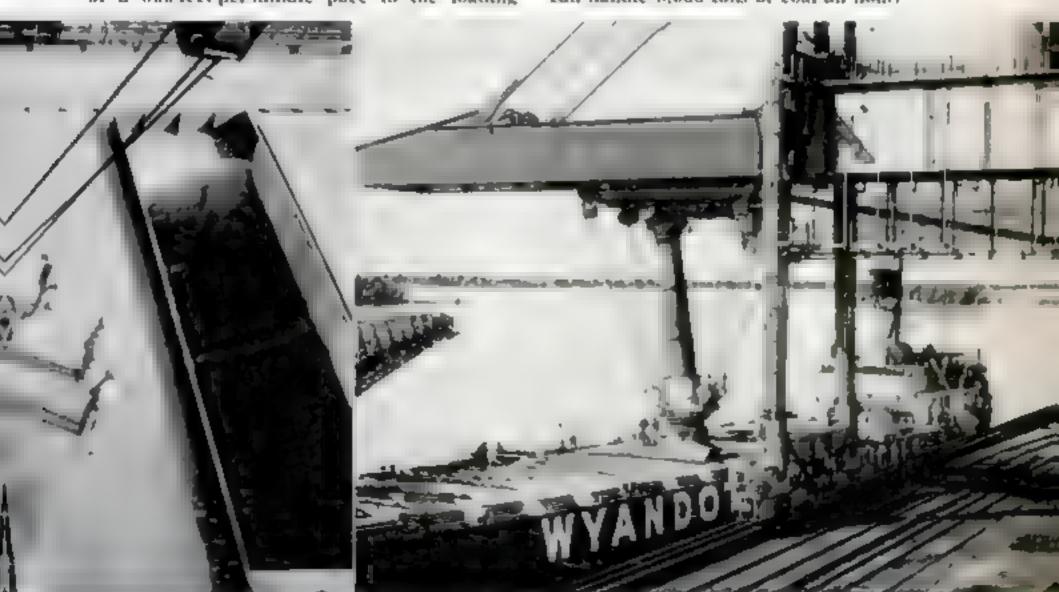

COAL SPEWS INTO SHIP'S HOLD from a rotating head that spreads the cargo evenly. The loader

operator follows telephoned directions. As a hatch fills up, the head is gradually lifted by

BARGEST CONVEYOR BELT of its kind speeds coal at a 600-teet-per-minute pace to the loading

dock. The rubber belt is eight feet wide and can handle 6,000 tons of coal an hour.

telescoping the tubular chute to which it's attached. To position the loading head over each

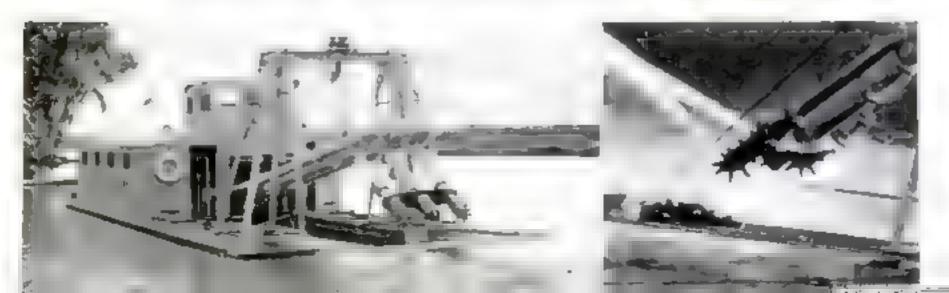

hatch in turn, the whole tower moves on rads.

The ship need not be moved for loading.

for this bus aren't going anywhere except shopping at their front doors. It's a rolling grocery store operated by Lawrence Jones, shown announcing specials of the day. The interior resembles a miniature supermarket. A gasoline generator runs refrigerators, meat slicer, lighting.

WATER-JET DREDGE. Two multi-nozzle heads (right) on this British dredge, when submerged, spout water to break up a river bed. At the same time, the jets create a powerful vacuum in a middle pipe that sucks up soil, vegetation and rocks, depositing them at points up to 1,000 feet away.

5 BUDGET SAVERS for Home Owners

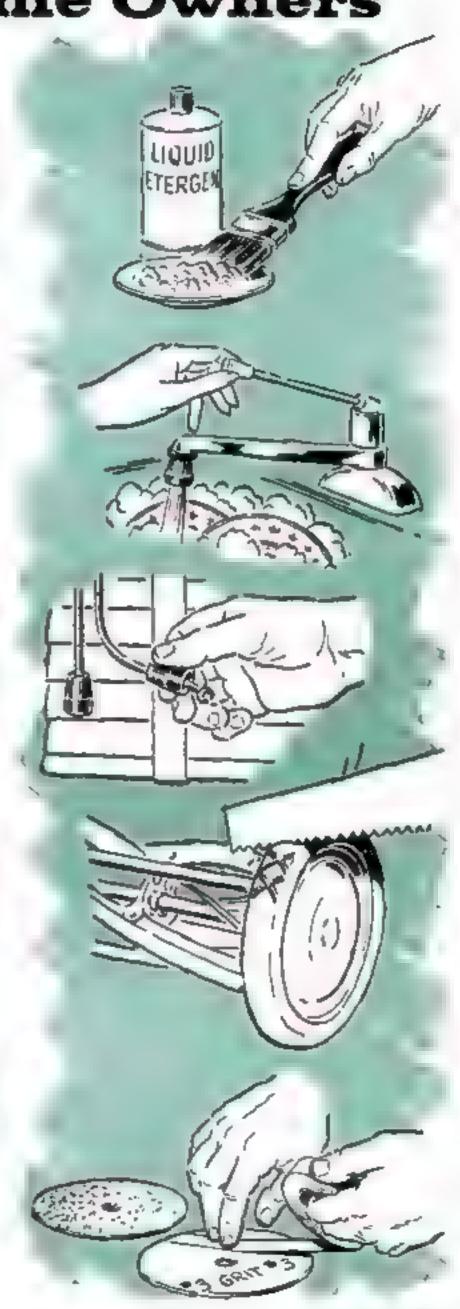

an all-purpose liquid detergent—or even a liquid laundry detergent. Put the brush on a saucer or can lid and pour enough detergent into the bristles to emulsify the paint. Work the liquid into the brush until every bristle is coated, then rinse it under a water tap. You can clean paint rollers the same way.

2 There's less breakage if you protect china and glassware from one natural hazard: the long-stemmed spout on a mixing faucet in the kitchen sink. Cushion it with a rubber crutch tip with the bottom cut out to allow water to flow through.

A bedraggied shade pull or cord pull for a Venetian blind can be replaced with the larger size of solderless connector. Just remove the wire spiral, and drill for the size of cord used. If the black finish doesn't please you, give the plastic a coat of colored enamel.

4 Overhauling an old lawn mower? You may find that the tires have hardened and the tread has worn away. You can restore their lost grip and some of their old bounce by cutting grooves across the rubber surface with an old saw.

5 Get longer life from sanding disks by slapping strips of masking tape across the back of each one. This reinforcement will keep a disk from folding and breaking while its abrasive surface is still good.

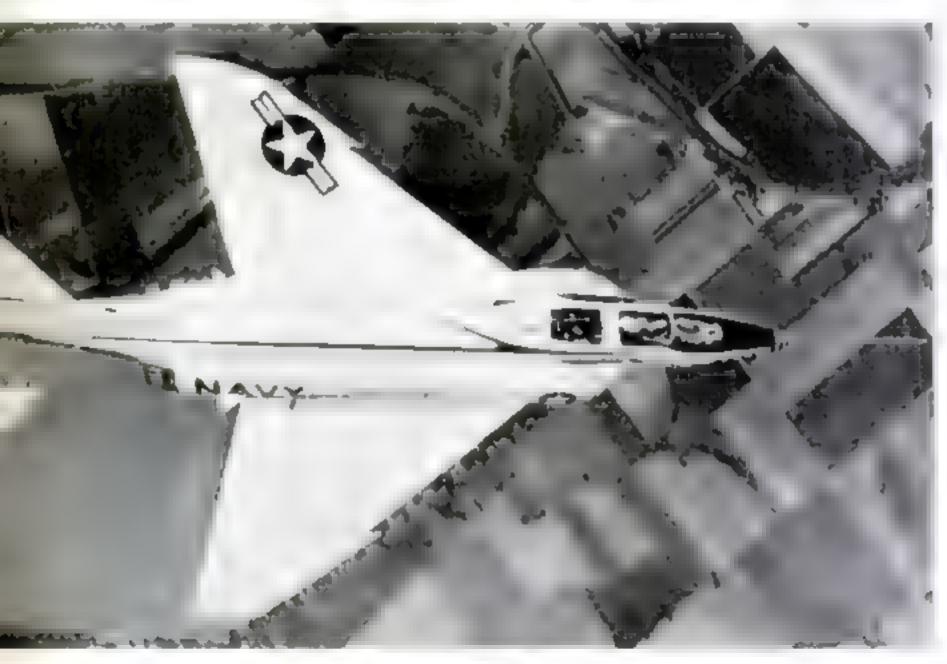

POLYHEDRAL BOTTOM. Protruding edges on this Higgins aluminum boat run below waterline for half its 52foot length. They cushion pounding, give it 40-m.p.h. speed carrying 30 passengers.

KINKED POWER POLE. Two crooks in the electric pole at this curve on a newly electrified German railroad let the swaying cars pass safely. There is also room left on the aidewalk for pedestrians.

weather interceptor, the McDonnell F4H, photographed over St. Louis. Powered by two GE J-79 jet engines, of 15,000 pounds' thrust each, it is designed to fly at better than Mach 2—twice the speed of sound.

MECHANICS AND HANDICRAFT

Snaking Power Wires Through the Walls

By Raiph Treves

HEN additional wiring is needed in an occupied house, cables can usually be fished through the walls without tearing the house apart. This holds true whether the job involves a new circuit to an upstairs bedroom for an air conditioner, wiring for new ceiling or wall lights, additional outlets in the living room, or appliance wiring in the kitchen.

A fishing tape is the chief tool in the electrician's bag of tricks. Also known as a snake, the tape is used to find an open trail and pull wires inside walls, through floors, and along vertical plumbing lines such as the vent stack.

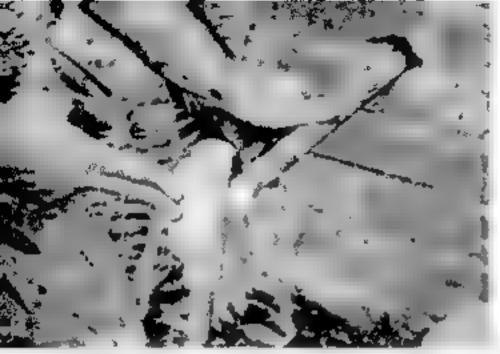

The tape is a flat-tempered steel wire. It is sold in electrical-supply stores in 50′, 75′ and 100′ coils for \$1 65 to \$3.70, depending

snaking tools: Most important is the coil of steel tape—the snake. Short sections of tape in the center of the photo show how the end is bent to form a hook for fishing, an offset hook for catching a second hook, and an eye for pulling wires through. Brace, extension but and flooring chisel complete the list of necessary tools.

THE SNAKE IS JIGGLED through any opening—a vent-pipe space often provides an easy path—to get it through the wall. New wiring, attached to the snake, can then be pulled through.

AN OUTSIDE CONDUIT is often the easiest way to carry new wiring to an upper floor. The conduit is usually placed so it enters the upper room behind the new outlet. It drops straight down along the house to the basement where wires can easily be run across joists to the fuse box.

primarily on the length of snake desired.

Another important tool is a long bit extension that will drill through from one floor to another. Extensions come in 12", 18" and 24" lengths with a square chuck at one end for clamping the shank of an auger bit. The other end fits a standard brace. Extensions are available for use with bits in an electric drill.

Using a snake. The coil of tape must be unwound carefully since it tends to lash out when let go. Several bindings of electrical tape placed at different windings of the coil permit release of only the needed length, Also, with the coil intact, it's easier to rotate the snake

when manipulating it.

Some tapes come with a knob at the end for use with a special eye for pulling cables, but generally a tight hook must be bent at the end of most tapes. To keep the springy steel from snapping, the end must be tempered before bending. It can be heated over a gas stove

If the tape must be pushed a long way between beams, a flashlight is helpful. Placed at the far end of the run, a glimmer of light visible at the starting point

will indicate a clear passage.

When the tape sticks or won't go around a sharp bend, a second tape pushed into the opposite end may catch it and pull it through. The helper tape should be rotated and moved back and forth until it hooks onto the first tape. It's like threading a needle in the dark, but even that can be done . . . with luck

If the passage is blocked, the loca-

tion of the obstruction can be found by sticking a bit of electrical tape on the snake where it enters the wall. Pulled out and held on the outside of the wall, the tip of the snake will tell where the wall must be cut to clear the way.

Planning the path. The first step is to decide on the location of the new fixture or outlet, and make the necessary wall or ceiling opening for it. The next decision is where to connect the new wiring to the power source. If there's a choice in locating the fixture or outlet, it's good strategy to favor a spot that will permit running wires through partition walls where they can be reached from both sides—preferably walls that adjoin a closet or utility room to minimize damage caused by fishing holes. Outside walls can be reached from only one side, and they are often filled with insulation that would hinder the progress of the snake. Also, to minimize trouble overhead, plan a path through the ceiling that will parallel the ceiling joists.

A single utility outlet or fixture can be spliced into the nearest available circuit. but an installation for a kitchen appliance, air conditioner or heavy-duty fan should be carried direct to the fuse box to prevent overloading existing circuits.

Keeping wall damage to a minimum. Holes in the wall are inevitable. A snake seldom will travel a long distance from one point to another without being helped along the way. Punch small holes first and try fishing through them before making larger holes. If the wall is papered, razor slits made in the paper will permit a flap to be sponged loose and peeled back. After the hole is patched, the flap can easily be glued in place to conceal the repair.

Another way of dealing with holes made for fishing is to install a new outlet in the hole, then continue the wiring to the original location. This method helps simplify the final installation of the wiring by serving as a splice box and permitting the use of shorter lengths.

Ceiling holes are easy to patch. The color is usually white or a light shade

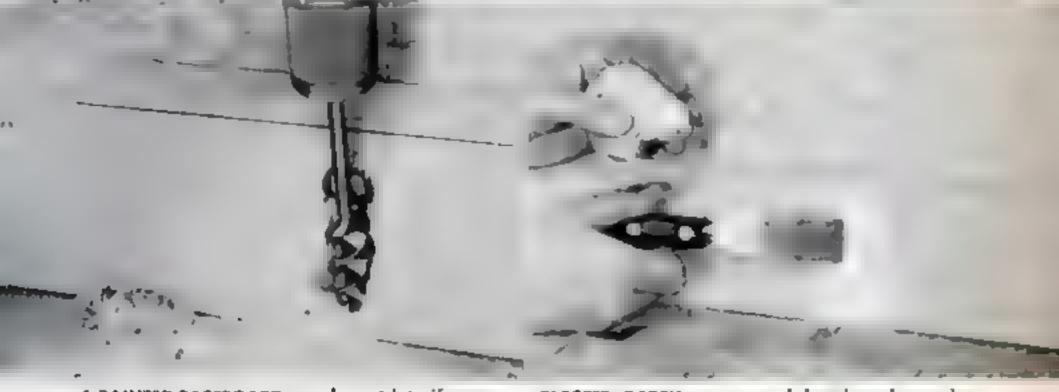

that's easy to match.

When running a new circuit from the basement to the top of the house, it often may be possible to snake along the vertical vent pipe, working down from a single hole made in the wall of the upstairs

when both levels are finished. Here the upstairs baseboard is removed and an extension bit is used to drill down into the wall below.

caste would be installed like this after a clear path had been drilled for it. Putting back the baseboard conceals the damage to the wall, making plaster patching unnecessary.

A PAINTED BASEBOARD may be cut into if removing it would cause damage. Breaking away plaster behind the cut gives room to start the bit, and makes it easy to snake the wire upward.

PLASTER PATCH in a wood baseboard can be sanded smooth after it dries—an easy fix for that hole at left. A touch-up of matching paint over the area makes the patch invisible.

bathroom. If this proves impossible, a conduit running outside the house from basement to top floor may save much wall chopping and drilling.

Drilling from floor to floor. In a onestory house, drilling is done upward from the basement, through the subflooring and the two-by-four plate in the wall directly beneath the new outlet opening. Accurate measurements must be taken upstairs and transferred to the basement to avoid having the bit emerge through the flooring

Drilling from the second floor is more complex as the hole must be started in a finished wall and end up between the walls. One way is to remove the base-board on the upper floor and chisel away the plaster to expose the floor plate in line with the proposed outlet below. The bit must be held as near plumb as possible, and by starting the hole in the near edge of the plate the chances of coming out inside the wall below are increased. The bit must travel 12" to 15" to go through the plate, the subflooring, the width of the joist and the top plate of the lower wall.

Removing a baseboard may not be easy. It could split or damage the wall paint. It can be cut into with small damage by boring three holes in a vertical line and chiseling away the material between them. Breaking through the plaster behind the cut gains access to the floor plate, and drilling proceeds as outlined above.

The gash in the baseboard is repaired with plaster after the wiring is installed. When dry, the plaster is sanded smooth (and shaped to blend with the cove molding, if that was cut, too). When painted, the plaster patch will be as smooth and hard as the original wood.

Tying wire to a snake. After successfully coaxing a snake from point to point, the next step is to pull it back, dragging the new cable with it. The frustration of

losing the wire midway in the pullback is such that it cannot be printed, so a secure tie is important,

One type of tie calls for stripping an inch or so of the wire and wrapping one leg around the tape, the other leg through the hook and around the other wire. Another method is to separate the wires and bend each into the hook from opposite sides. The wire ends are then bent down and wound around themselves beneath the hook.

Concealing the cables. Where wires must run outside the wall, as when traveling laterally across a stud-filled partition, cables can be concealed in several ways:

 Behind the baseboard. The baseboard is removed and a narrow channel is chiseled into the plaster behind it. Replacing the baseboard covers the wiring and no wall patching is needed.

Below the baseboard. Here, too, the baseboard is removed and a %" strip is ripped from the bottom edge. The cable is laid along the floor and the baseboard replaced above it. The gap between baseboard and floor is hidden by a new shoe molding

 Behind the base molding. Only the cove molding on top of the baseboard is removed and the plaster behind it carefully chiseled out. The cable is set in the

tooks MESSY BUT ISN'T: Cove molding on top of the basehoard is removed and cable set in

groove chopped in the plaster behind it. Replacing the molding conceals groove and cable.

groove and covered by replacing the molding. Caution: Drive nails downward into the baseboard to avoid hitting the wires.

 Weaving in and out of the wall. Usually a last resort because of the patching involved, the cable is threaded in and out of the wall around each stud. The cable is stapled flat against the studs and is plastered over.

Ceiling installations. In a one-story home with an unfinished attic, it is only necessary to bring a cable from a nearby circuit and install the fixture from above. The switch leg is dropped through a hole in the wall plate and fished out at the opening for the wall plate.

Where the floor above is finished, removing a section of flooring to avoid damage to the ceiling may be worthwhile. A flooring chisel is used to slice into the tongue and groove, and a strip of flooring is lifted. The subfloor beneath it is chiseled or grooved with a portable saw and the cable set in the groove. After connecting the cable to the fixture and dropping the switch leg down into the wall, the strip of finished flooring is nailed back in place to cover both groove and cable

Wherever possible, it's a good idea to complete the wiring and install the fixture and switches to be sure everything's in order before patching over.

WIRES ARE TIED SECURELY to the eve bent on the end of the snake. To prevent losing the cable on a hard pull around a corner, the tre should be firm but not bulky enough to snag.

SMAIL HOLES IN PAPERED WALL can be concealed by sponging loose a strip of the paper and bending it back. After the hole is filled in, paper is glued back in place to cover the patch.

CABLE CAN BE WOVEN IN AND OUT of the wall, through small holes punched on each side of

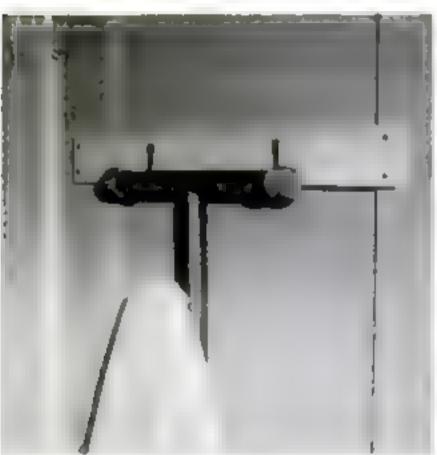

the studs. Studs can be notched to recess the cable, and the holes plastered over.

Getting More Wash on a Clothesline

WHEN I have an extralarge wash, I clip small items together with clothespins so they hang in rows. It conserves space on the line and doesn't increase the drying time.—Sylvia Laskow, Los Angeles.

WITH BECAUSE I keep box and open-end wrenches in a bag in my car, I painted the eighth sizes yellow; fourths, red; and left the sixteenths unpainted. Now I can pick out any size I want in seconds.—

Charles P. FitzPatrick, Philadelphia.

Support for Hangers on Door

To hang objects such as an ironing board, towel rack or full-length mirror on a door having a recessed panel, you will need a firm support for the hooks. A 3"-wide board screwed to the stiles makes an effective span for the panel.—

Bert Slanhoff, Mt. Vernon, N.Y.

A DRILL-CHUCK key used continuously through the day soon becomes uncomfortable and hard to hold. I put a length of rubber hose on each side of the T. It improves gripping and prevents slipping when you get oil on your hands or the key.—Henry J. Greene, Oklahoma City.

This Mousetrap Catches Fish

I SCREWED a new, clean mousetrap to the end of a 2' length of plank to make' a cleaning board for fish.

Clamped under the spring, the tail is held tight while I scale the fish.—
George J. Berkwitt, NYC.

A Clothes Corral for a Young Cowpoke

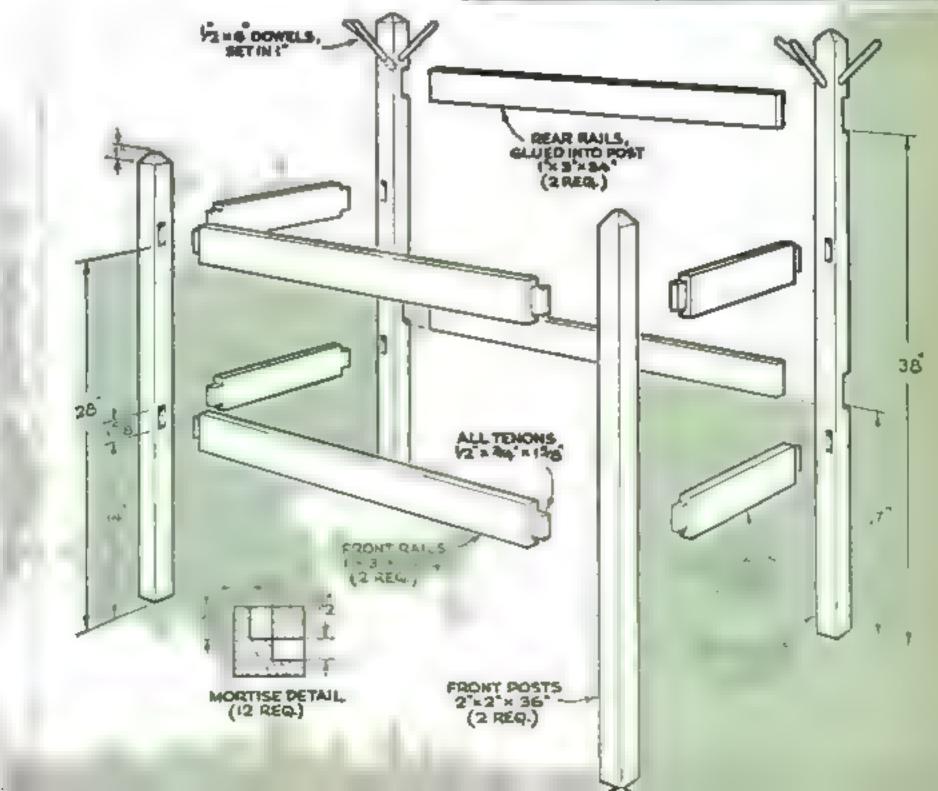

TERE'S a clothes corral that gives pint-sized cowpokes a big kick when they hang up their chaps, gunbelt and sombrero before turning in. It has plenty

of room for airing blankets, too.

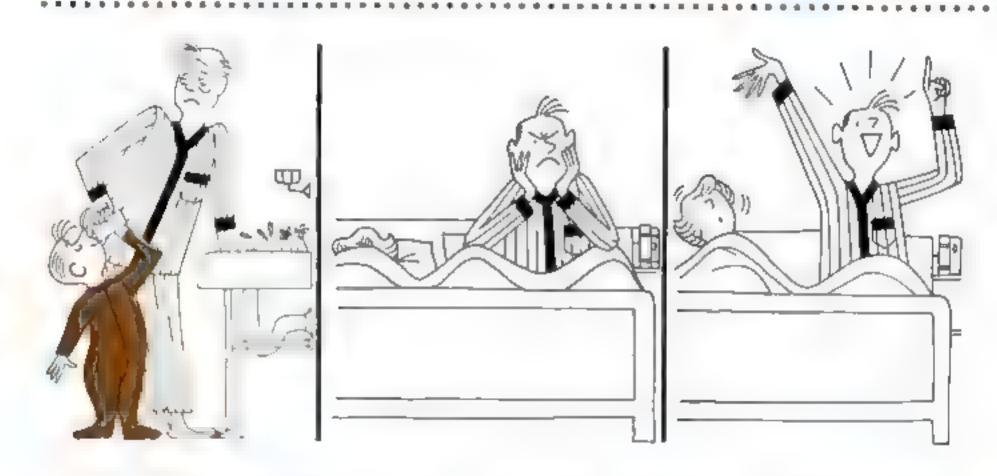

Materials? About 14' of two-by-two, 17' of one-by-three, and 3' of 1/2" doweling. I used mortise-and-tenon joints in most places, but you might prefer simpler butt joints with dowels. Or, easier yet, you can screw or bolt rails to the outside of the posts and have them meet in mitered corners.

For added Western flavor I gouged into the flat sides of the rails for a hand-hewn effect and smoothed them with sandpaper. The rough-finished wood was branded with a soldering iron and given two coats of clear sealer-lacquer.-David Farkell, If hite Bear Lake, Minn.

fit stops it, too.

That's putting inertia to work-one of the many ways you can benefit from the physical property of matter that Sir Isaac Newton made the subject of his first law of motion.

To use inertia as a valuable, everyday helper, you should keep these two im-

DRIVING NAILS IN UNSUPPORTED WORK goes quickly and without risk of damage if you use a heavy backing block. The block will bounce away each time you strike a blow, but not before the hammer has advanced the nail.

and grub hoes. Here the handle

flares out toward the end. After

slipping the eye of the head over

the back of the handle, you tighten

it by striking the end sharply while

the tool is pointed down.

FREEING A TWIST-DRILL SECTION broken off flush with the work is often possible with an assist from inertia. Grip the other end of the stock and tap close to the hole. This way you drive the work away from the drill end.

RAPPING A FILE HANDLE sets it in sudden motion. The loose ble remains stationary at the moment of impact and the bandle lorces its way over the line. I se the same method to tighten the bandles on chisels and most types of carving tools.

portant Newtonian observations in mind:

 Abruptly stopping a moving object will let loose parts shoot ahead

 Abruptly starting a dead-still object will leave loose parts behind

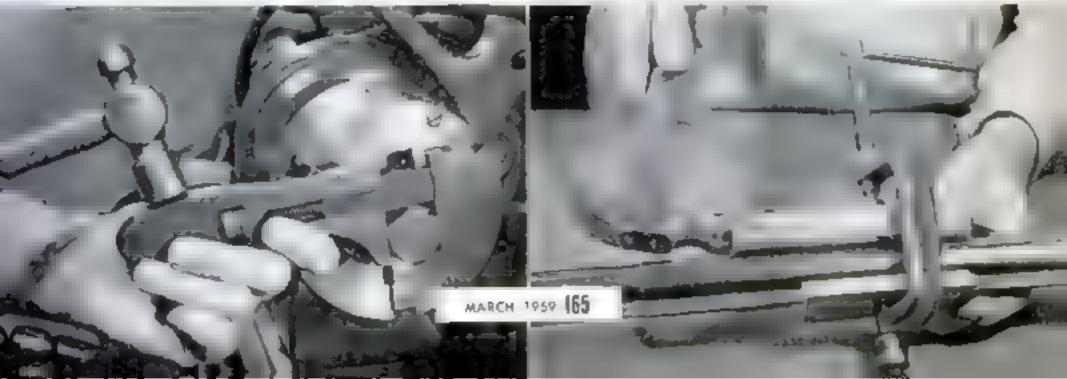

In each case, the loose parts tend to shoot ahead or stay behind even when they can't. With the hammer, the head would fly the full length of the handle and smack your wrist if the shank wasn't shaped to stop it. This means that you can sometimes use inertia to loosen parts as well as tighten them

MISUSED INERTIA: Whipping a brush downward and then stopping it abruptly clears it of paint and solvent, all right. But it s tough on the bristles, which are farmed out violently by the same lorce, and may not repoint.

this way: Tighten a bolt in the jaws; then apply a wrench to its head and tap the handle lightly. Inertia of the spindle and pulley resists rotation. As a result, the chuck is easily freed.

PARTING TUBING—vacuum-eleaner extensions, for example—is easy with this setup. Clamp blocks on both sides of the outer section and give one block a number of sharp raps with a hammer, striking away from the joint

Now Outboards Can Be

FELLED

WO Californians have worked out an ingenious way to convert any small outboard from propeller to jet propulsion. For \$35 to \$60, depending on motor size, you buy a device called a Hydro Drive. Made of aluminum and weighing two pounds, it can be substituted for the standard lower unit of an outboard in five minutes.

The Hydro Drive offers the boater two special advantages: It's much safer for carelessly placed fingers and toes than a prop-appreciated by skin divers based on a power boat. And fishermen or duck hunters can fearlessly slither their boats

through weed-choked waters.

Propelling a boat forward by shooting a stream of water astern is not new. But previous applications of Newton's Third Law of Motion ("to every action there is an equal and opposite reaction") have been on inboard motorboats. Stanley Griffin and his son Robert, of Costa Mesa, Cal., appear to have the first out-

board using this principle.

Their Hydro Drive device comes attached to a two-foot length of driveshaft and is contained in a flat, snail-shaped housing called an involute. Inside is an impeller that whirls at a maximum speed of 5,000 r.p.m., sucking in water through a tough, round-holed screen in the bottom of the housing. The water swirls through a curving tube that's narrow at the inlet, becoming gradually wider toward the exhaust.

When driven by a three-hp, outboard engine at full throttle, the impeller pumps water out the tailpipe at the rate of 40 gallons a minute, developing 19 pounds of static thrust. Even strong swimmers have failed to make headway against this underwater blast; one or two lost their trunks in the attempt.

The Hydro Drive's water jet shoves an eight-to-12-foot boat along nearly as fast as a propellered engine of the same horsepower-on 25 percent less fuel.

Oddly, it will move big boats that a propeller-driven outboard of identical horsepower doesn't budge. And the Griffins have demonstrated that their jet drive enables a boat to crawl right up a stiff, foaming current that would overwhelm a comparably powered prop.

True, there is no way to reverse the Griffin Hydro Drive - except to swing the outboard engine around until it faces backward. This is impossible on the stern of an eight-foot dinghy, where it works most efficiently. But the Griffins have

devised a neat solution.

Cutting a well in an unconventional craft like a paddleboard or a moldedplastic scooter, they mount in it a jet outboard with steering wheel on top. The engine can be swiveled in any direction. it can even move the accorter sideways.

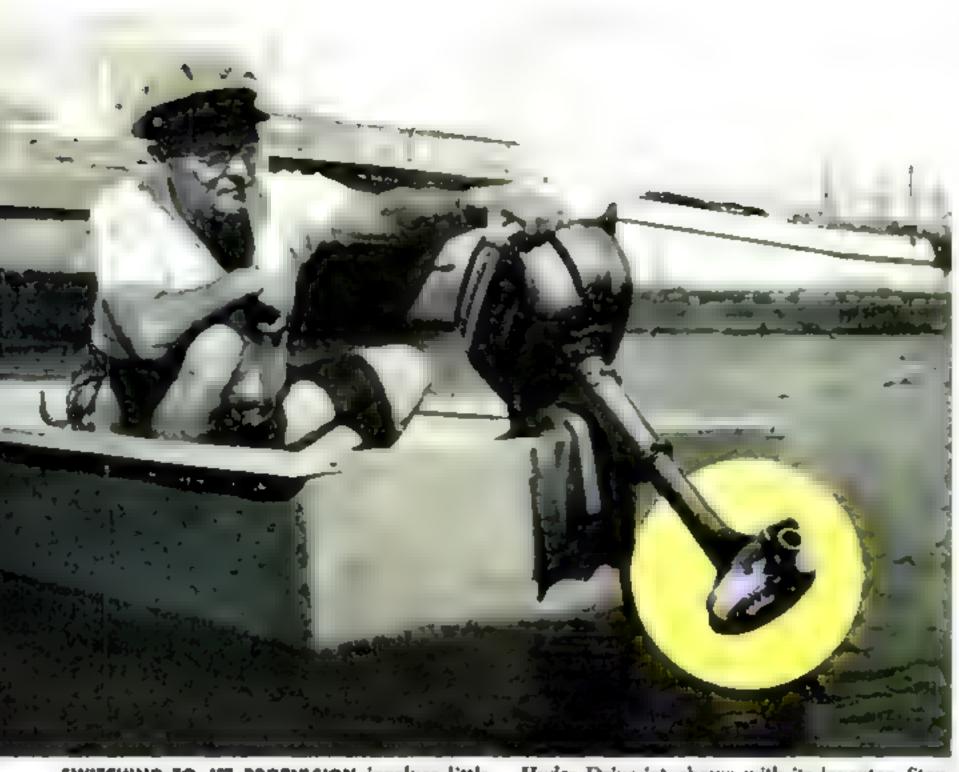

Griffin Hydro Drive Co., 1990 Harbor Blvd., Costa Mesa, Cal. makes units for

three- to 6½-hp, engines.

HYDRO DRIVE PARTS include (left to right) the involute or housing, an impeller, the pump cover and a driveshaft with parts of the engine's water-cooling pump attached to it.

166 POPULAR SCIENCE

switching to jet propulsion involves little more than removing and replacing four bolts on the lower unit of a regular outboard. The

Hydro Drive jet, shown with its inventor, Stanley Griffin, draws from eight to 12 mehes less water than a standard outboard propeller.

JET STREAM spurts visibly from a three-hp. motor when it's tilted upward. The stream would work as well in air: Reaction to thrust, not back pressure from the water, propels the boat.

A MODIFIED PADDLEBOARD has its deck partly cut away to form a cockpit and motor well. The craft, designed especially for fishermen, is steered by turning a wheel atop the motor.

There's a Trick to Planing Crossgrained Hardwoods

You may have discovered that it's almost impossible to surface curly maple or other crossgrained hardwoods on a jointer without chipping half moons in the face. A water treatment helps.

Lay the piece on newspaper and wet the surface with a sponge two or three

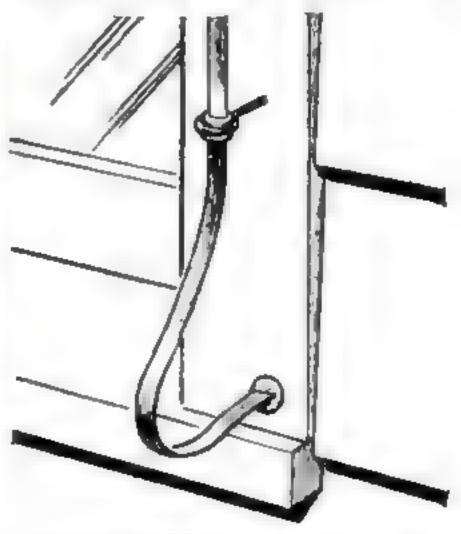

times. Let it soak about 10 minutes, wipe with a cloth, and plane with a light cut. If another pass is needed, dampen and wipe again. Most of the wet wood cuts away, leaving a smooth surface that will dry quickly and require a minimum of sanding.-Edwin M. Love, Palmdale, Cal.

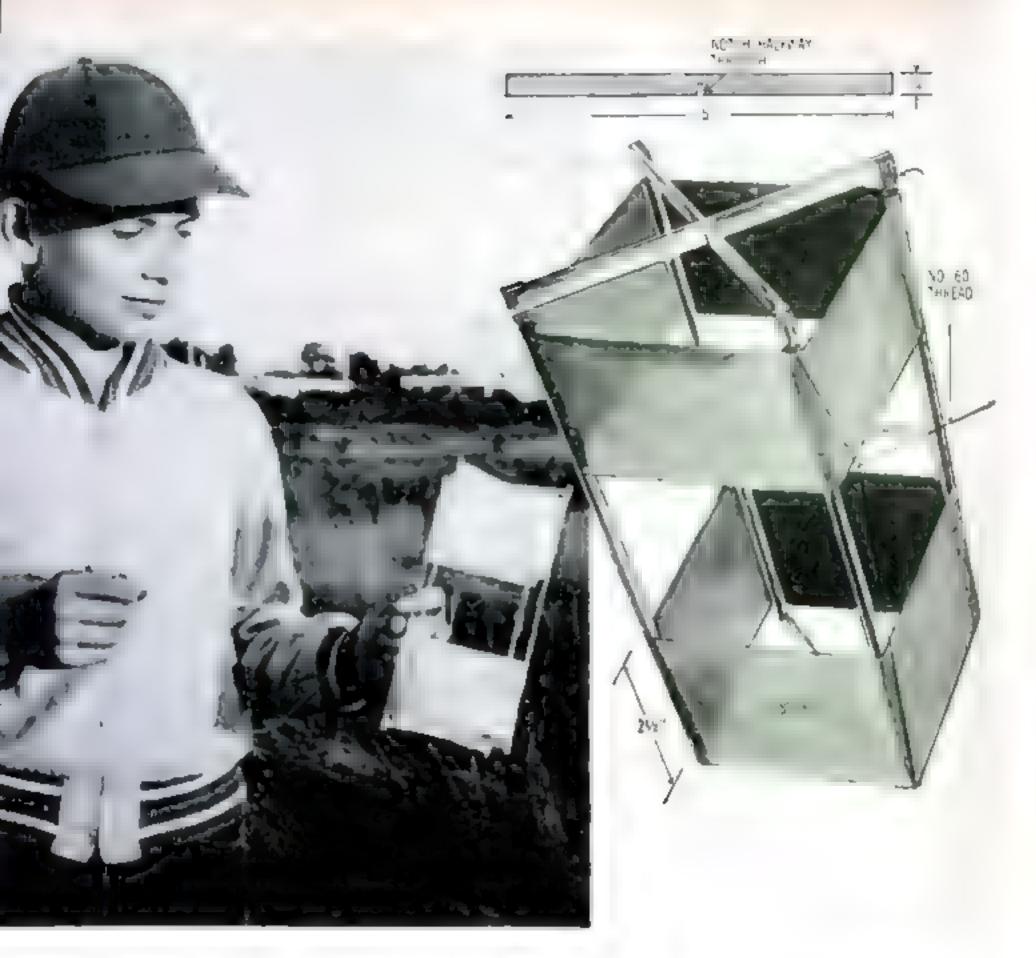

HERE'S a good way to keep the chucks of a coping saw from marring the finish on a piece that is being sawed. Slice two thin disks off a cork with a razor blade and pierce them in the center. Slip these over the blade and cut with one on each side.—Bil Toman, Palatine, Ill.

Tip on Installing TV Lead

An easy and efficient way to feed a TV lead through a window or door frame is to bore a 3/4" hole in a member that doesn't open. After you thread in the lead, putty up the hole and repaint; the lead will appear to be molded right into the wood. -Hugh M. Gordon, Burlington, Ont.

Soda Straws

Frame Tiny Box Kite

AN IMPULSE is about all you need to build this miniature box kite; there's no elaborate list of materials.

Only 3½" square and the length of a soda straw, it performs in a light breeze with the stability of a kite 10 times its size—and you can fly it on a spool of thread.

Construction consists of razoring four 1/4" strips of thin balsa and notching the center of each to make two cross-lapped X frames. Cement balsa tabs to the frame ends and taper the tabs to fit in the ends of four soda straws. If you've a choice, the thin cellophane straws are

lighter than the waxed-paper kind. But either will do.

Wrap each end of the soda-straw frame with a 2½"-wide band of tissue and cement the bands in place.

For the bridle, the a length of thread (No. 60 cotton is strong enough) to the top and bottom of one straw, leaving an inch or two of slack. Then tie the flying thread to the bridle. Any breeze better than three m.p.h. will carry the kite aloft. Lacking a breeze, you can tow it at a brisk walk or slow trot to make it rise.

—Lig Mayhew, Cleveland.

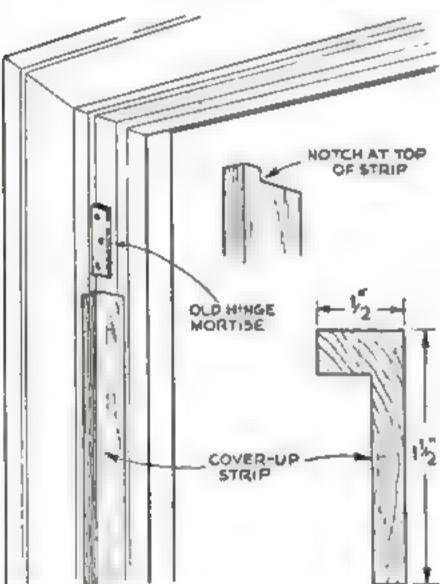

Work Supported by Hammock Frame

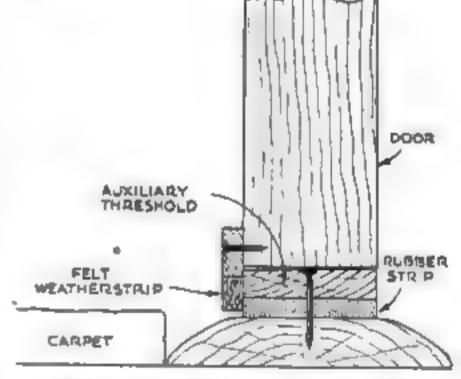

I MAKE my portable hammock frame do double duty —it serves me as sawhorses as well as for lounging.

Inverted, it takes work for sawing, painting and other jobs. I protect the metal with papers.—E. A. Rerucha, Franklin Park, III.

edge of a plane blade inside the plane before you store it. But if you don't, at least snap a wide, heavy rubber band around the plane to cover the cutting edge and prevent nicks from contact with other tools.—Ken Murray, Colon, Mich.

Cover Strip Dresses Doorway

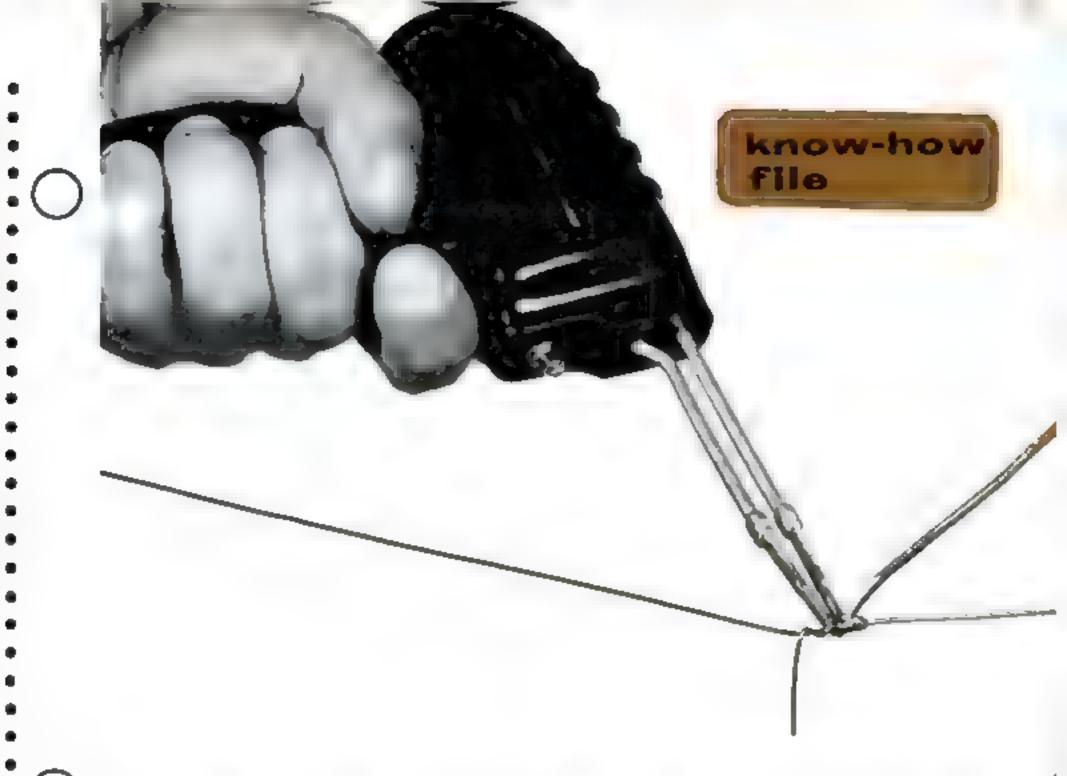

When you remove a door in an old house to make a modern cased opening, you can hide the hinge and latch mortises with an L-shaped cap mold that you can saw out from lengths of \(\frac{1}{2}\)"-by-\(\frac{1}{2}\)" stock.

The strip must be measured for each job to assure a good fit. Nail up with 1" brads, sinking the heads and covering with wood filler. When it's finished to match the rest of the trim, no one will suspect that a door had been hung in the opening.—Harold Jackson, Kankakee, Ill.

Weatherstripping a Short Door

When we installed wall-to-wall carpet in our living room, the high tufting interfered with opening the front door. So we cut 1/4" off the bottom of the door.

Then to get a tight weather seal, I made an auxiliary threshold of this strip, tapering it to allow the door to start in the opening and nailing it to the original threshold over a length of rubber. The squeezed fit is anug even without the felt weatherstripping I used for added insurance.—Morris Roth, Duncan, Okla.

A Beginner's Guide to Soldering

HERE'S nothing mysterious about soft soldering. Your sawy starts when you understand how a mixture of tin and lead bonds other metals. It isn't a fusing process like brazing or welding. Instead, chemistry does the trick. At a temperature well below the melting point of the work, the solder dissolves a small amount of the surface metal and blends with it.

This solvent action can't take place unless you.

- Clean the metal. All traces of insulation, paint, grease, rust, oxidation or other nonmetallic coatings must be cut, filed, wire-brushed or sanded off.
- Apply heat to the metal—not directly to the solder. For a good blend the work must be as hot as the molten tin and lead. It will be when the iron or

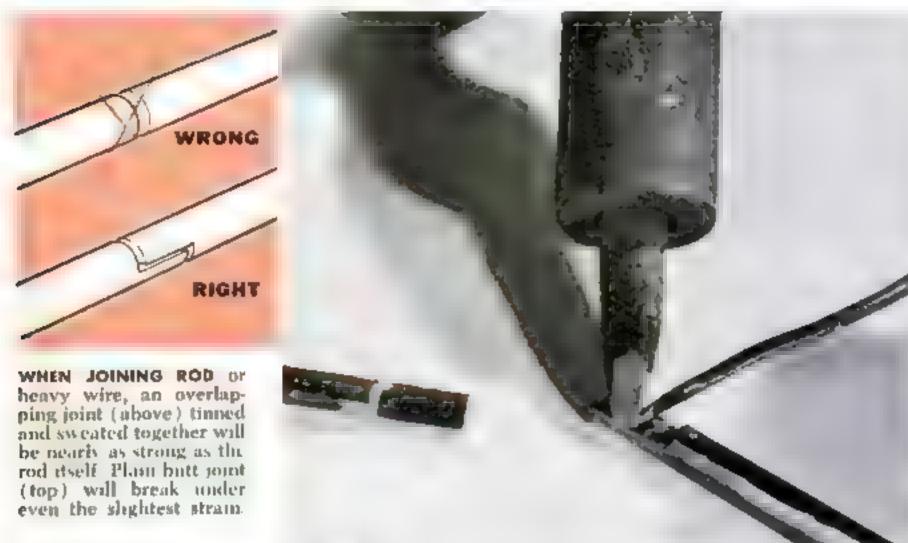

torch has raised its temperature enough to make the solder flow.

 Use flux. The moment you apply soldering heat to the work, a new oxide starts to form. The purpose of the flux is to float it off and hold it in suspension until the solder melts and the surface metal is dissolved

Gun, iron or torch? In general, a gun is handiest in close quarters. It also offers you the convenience of almost instant heat, and the safety and economy of automatic shut-off when you release the trigger.

For most household repairs and sheetmetal projects, you'll make out fine with a conventional soldering iron (150 watts or more). Torches, particularly the ones that use pressurized gas, are good for the big jobs—sealing pipe joints and stopping

How to solder strong mechanical joints

WRAP WIRE AROUND ITSELF and join it with a blob of solder. A wire form assembled in this way will have less tendency to break apart than one made of four separate pieces.

leaks in gutters, repairing or applying flashing.

What kind of solder? Soft solder is manufactured in thousands of alloy proportions, shapes and sizes. The alloys you'll find most useful contain from 40 to 60 percent tin. Whenever the ratio is specified by some such symbol as 40/60, 50/50 or 60/40, the first number refers to the tin and the second to the lead. The 40/60 variety is the least expensive, and works well for most purposes. However, alloys having a higher tin content make somewhat stronger bonds.

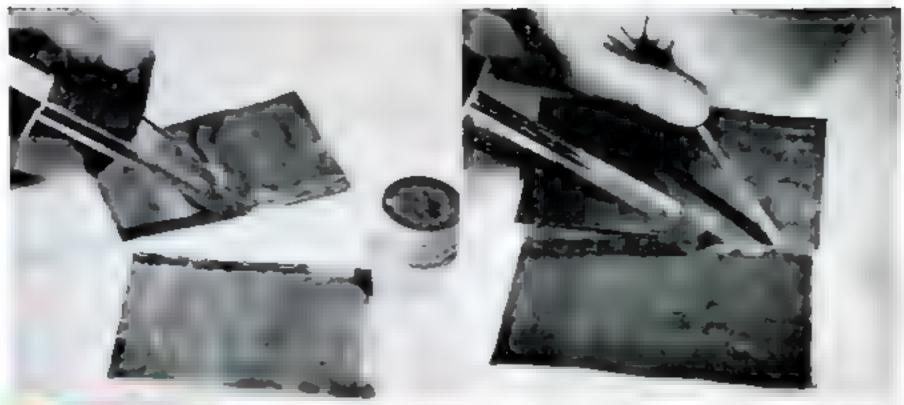

Economical one-pound bars are good for large torch and melting-pot operations, but you'll find wire solder much easier to handle in the tight spots. You can buy it either solid or with a flux core The former costs less, but you still need flux. The latter is tubular, with just enough flux inside to keep surfaces clean while the solder blends with them. Both wire types come in a wide range of diameters, or gauges. Select the size in relation to the job—overloading a joint won't increase its strength

One more product worth considering is soldering compound. Here, finely powdered tin and lead are suspended in a heavy flux. This silvery-gray paste is generally used to join parts that can't be reached with an iron or gun. Applied to a small wire splice or terminal connection, it can be melted with the heat of a match. It's also handy for soldering one flat surface to another. You simply trowel it on the mating areas, press them together and apply heat.

A word of caution, though. The heavy tin-lead dust settles rapidly to the bottom of the flux. Stir the compound each time you use it.

Choosing the right flux. Whether you buy flux separately, or use flux-core solder or soldering compound, you have

Two ways to join sheet metal

SIMPLE OVERLAPPING JOINT is adequate for most sheet-metal jobs. Cut the pieces large enough to overlap about a half-inch, and carefully sandpaper the meeting surfaces. Apply flux and coat each edge with solder, then join or clamp them and run a hot from along the joint, flowing in more solder if needed.

CRIMPED JOINT should be used when metal is subjected to stress or vibration. Allow enough extra metal to fold over the meeting edges and bring them together as at left. Flow solder into the folds, preferably on both sides for maximum strength. Besides being extra strong, this joint stiffens the metal.

a choice of three basic types. These are chloride (usually called "acid" type), organic and resin.

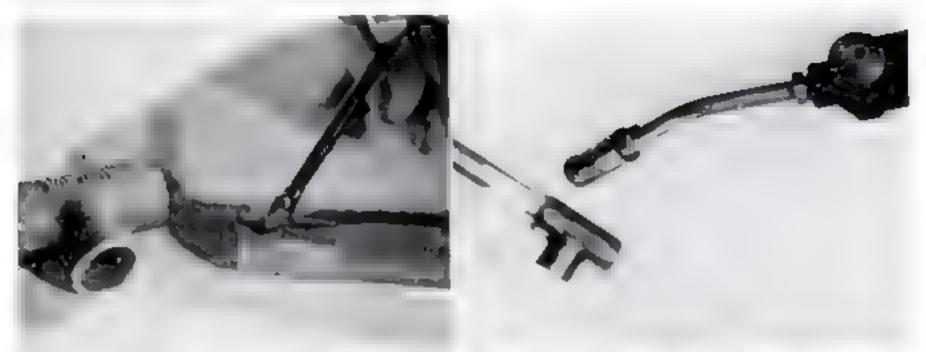

Never use anything but resin flux for electrical connections. Unlike the other two types, it's completely noncorrosive after cooling. Chloride is your best bet when you're working with large chunks of metal and must pour on the heat for some minutes to bring it to solder-melting temperature. Its residue is highly corrosive, however, and should be removed with vigorous hot-water scrubbing after joints have set.

Organic flux is a good choice for runof-the-mill soldering. It won't hold up under heat as long as chloride, but its dry and withered residue is not nearly so corrosive, and can be brushed or rubbed off easily.

During soldering, both the chloride and organic types are much more active than resin, with chloride slightly out in front. This means they'll set the stage for stronger joints when you're soldering difficult ferrous metals.

How to tin an iron or gun. Metal surfaces to be soldered must be free from

A torch is best for sweat joints

SWEAT JOINTS require a different technique. If the joint was pretinned, it probably would not fit together, so clean the tube and the inside of the fitting, apply flux and assemble the parts.

Heat the joint with a torch until the metal becomes hot enough to melt the solder on contact. Continue heating until the solder flows smoothly into and fills the entire joint.

oxide. The same goes for the working end of an iron. A new one often has a thin coating of solder on each face of its tip. Without this "tinning," oxide builds up rapidly on the hot copper, preventing heat transmission.

If an iron hasn't been tinned, or needs retinning (they all do at frequent intervals if they're used much), plug in the juice. Then file each of the tip faces until it's clean and shiny. Wait until the copper starts to darken from the heat, then rub flux-coated or -cored solder lightly but thoroughly across each face. Wipe off the excess with a cloth pad. Use the same technique to tin the tip of a soldering gun.

Applying the heat. Heat should be carried to the solder by way of the work surfaces. The only exceptions are when you've already bonded the alloy to the metal and want to build up a fillet or level out a dent. Then you can apply additional solder directly with the tip.

A common beginner's mistake is using the point of the iron like a pencil. This way, little heat is transmitted to the work. Lay the flat, or flats, of the tip firmly against the metal surfaces and ease along slowly enough to melt the trailing or parallel solder. If you're new at this, practice on a couple of strips of tin-can stock, the easiest of all metals to join. With the right timing, you'll be surprised at how evenly the solder levels itself as it becomes molten.

When soldering wire, apply heat to the

underside, touching the solder to the top. Then roll the tip slightly upward on both sides to catch and level any unsightly beads.

In all soldering, when you see too much molten alloy building up, wipe it off quickly with a rag. That's easier than filing or sanding the abrasive-clogging excess away after it sets.

Torch soldering. Here you work with higher temperatures that cause all but chloride-type fluxes to break down rapidly. Adjust the valve for a clear blue flame no longer than necessary, and direct it slightly away from the soldering area to hold oxidation down.

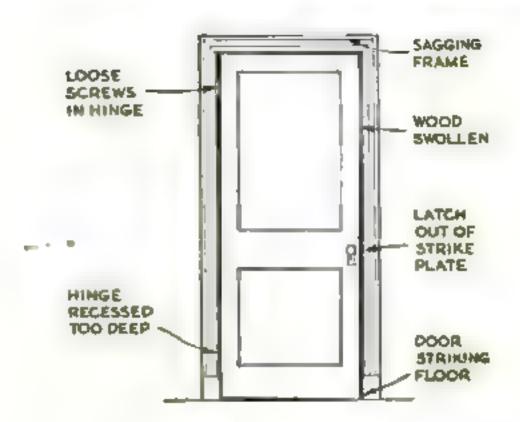

Don't let the work slip. Some soldering may make you wish you had three hands—one to grip the metal parts, either directly or with pliers or a hold-down, another to apply the solder, and the third to handle the heating tool. Clamps often solve this problem, but when you use ones made of metal, insulate their jaws with little pads of wood to prevent heat carry-off. You can learn to hold both wire solder and an iron in one hand, maneuvering them like chopsticks, Again, wire solder can be cut to lengths and laid along a seam.

How you manage is not nearly as important as preventing a slip just before the solder sets. When this happens it will turn gray. That's bad—a sure sign that the joint will be weak. If this happens, run your iron, gun or torch back over the metal and try again.

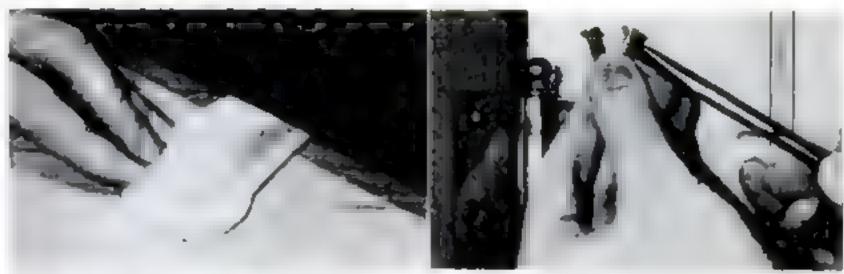

Door Repairs 1

fix-it file

STICKING DOORS or doors that won't stay closed result from many things: loose or poorly set hinges, screws loose in wood, house settling and forcing jamb out of square, wood swollen from moisture or shrunk from dry heat. Carefully check all alignment factors before you plane off wood that may have to be glued back on door edges later. Planing is the last resort, when other methode fail to work.

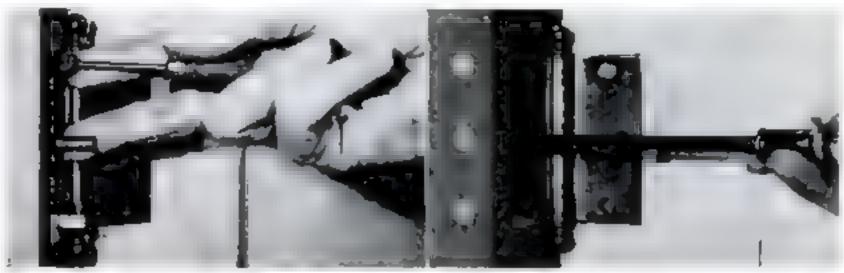

How to tighten hinges

seront rightening Loose hinges, prop up the bottom of the door with a wedge to take the strain off the screws. Otherwise, the weight of the door may cause the screws to strip the holes when tightened. IF SCREWS CAN'T BE TIGHTENED, try longer ones of the same diameter, or use sheet-metal screws, which are threaded along the entire shank. If thicker screws are used, enlarge the hinge boles for their heads.

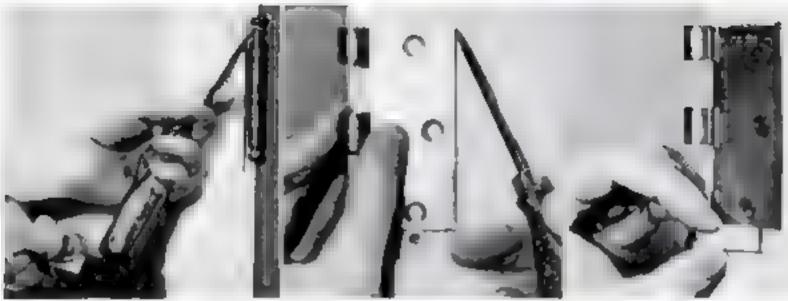

How to reset screws

WHERE HOLES ARE HOPELESSLY STRIPPED, remove screws and tamp in steel wool or wood putty, or force in fiber screw anchors or gluecoated wood plugs. Wait until glue or wood putty sets before driving in screws.

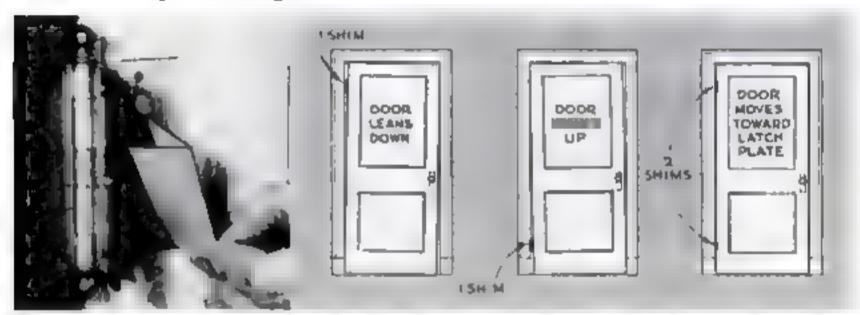

provide NEW, CROSS-GRAIN WOOD for screws to grip by drilling into door in line with screws but at right angles, and gluing dowels in holes. Trim dowel ends flush with door and sand smooth; then reset screws.

How to reset hinges

IF PATCHING WON'T WORK, your best bet is to shift the hinges to give the screws a fresh start in new wood. Most hinge pins can be tapped out with a hammer to separate the two halves. Shift the hinge leaf enough to clear the old screw holes and scribe in the area to be chiseled away. After enlarging the hinge gain to the new position, fill in the gap below the hinge with a thin sliver of wood. Glue it in place and sand flush.

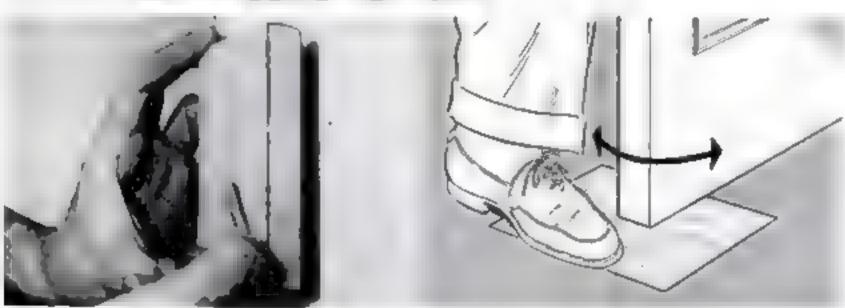

How to adjust hinges

SOMETIMES A BIT OF PAPER folded in half may be the answer to a door problem. Remove the hinge screws and cut the paper to fit the gain. Use two or more sheets if necessary to make a shim of the required thickness.

Remember that a shim placed under the lower bings will lift the door upward; placed in the top bings it will move the door outward and down. Shims under both hinges may help a latch to reach the strike plate.

How to sand dragging high spots

LIGHT SANDING may free a door that catches only on small high spots. Sandpaper tacked to a wood block as shown will cut down high spots on the jamb without removing wood or paint from inside edges of stop strips.

IF DOOR RUBS THRESHOLD when closed, or if it scrapes the floor when fully opened, place a sheet of coarse sandpaper on the floor, hold it with one foot and work the door over it uptil it no longer makes contact.

materials file

Contact

the adhesive that's stuck on itself

ONTACT cement was developed for sticking down counter tops, and it is widely used to put up plywood panels without nails. But even though you may not be planning to tackle either of these projects, contact cement has a place on your utility shelf.

The beauty of this many-purpose, quick-grab adhesive is that it will stick almost anything to anything—and without the benefit of clamps. But don't use it in place of wood glue where a maximum-strength bond is called for. It's not that strong And don't use it like ordinary glue. It must dry before you put the joint together.

Contact cement is synthetic rubber and resins in a volatile solvent. When the solvent evaporates, a pressure-sensitive adhesive is created. But it's the kind that will stick well only to itself. Touch two such surfaces together and they will grab instantly. Other things, however, won't readily stick to a dry film of contact cement.

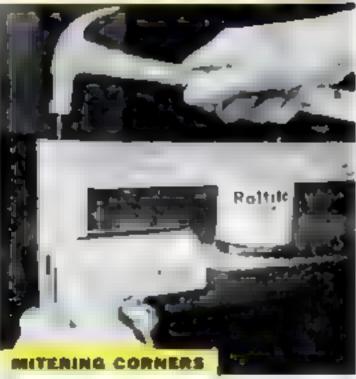

Basic technique of contact adhesion is simple enough. Spread the cement on both surfaces. Give it 30 minutes to dry. Then press the surfaces accurately and firmly together. That's all you need to know to do an acceptable job in most situations.

The surfaces you can bond with contact cement may be almost any material you're likely to work with around the home or shop—including many on which no other adhesive is worth beans. It works well on wood and plywood,

4 of the many jobs you can do

hardboard and wallboard, plaster and concrete, cardboard and felt, rubber and leather (both real and artificial), and other porous materials.

It handles such hard-to-glue things as metal and glass (mirrors, too), plastic, neoprene and glass-fiber laminates.

All areas to be joined must be clean and dry. If they are metal or other nonporous surfaces, use sandpaper to roughen them up if you can do it without damage to the work. Clean with a solvent such as lacquer thinner and wipe dry.

Be sure that the materials are not cold. Both the cement and the surfaces should be at ordinary room temperature—around 70 degrees—if you want the

best bond.

How to apply it. Spread the cement with a notched trowel if you're covering a large surface. Contact cement works best when applied heavily, and a notched applicator puts on just the right amount.

Several makers offer applicators to go with their adhesive. It's best to put an unusually heavy coat on porous surfaces where some will aink in. To do this, hold the applicator so the teeth are at a right angle to the surface. This is a good idea with softwood (including plywood), untempered hardboard and most kinds of wallboard.

How many coats? How thick the coats of cement should be and how many of them, depends on the materials—how porous or absorbent they are. If you are resticking the ivory veneer to a piano key, for instance, one coat is enough. To join a felt base to the porcelain base of a lamp or vase, each will take three or four coats. The same holds true for the end grain of softwood. Use at least two coats on any vertical surfaces. For fastening a metal plaque or monogram to a flat metal, glass or plastic surface, one coat will do.

Remember to allow at least 30 minutes' drying time for each coat, but anything up to two bours is perfectly safe. When you put the two surfaces together, they should be tacky but not wet. Test them by lightly pressing a bit of wrapping paper against the surfaces. The paper should come away without lifting any of the cement.

Join the surfaces accurately the first time. The virtue of contact cement is its quick and positive grab—and this means you can't move the parts once they touch. For putting a loose tile back in place this poses no problem. With large surfaces you can do the positioning with wrapping paper in between. In repairing rainware and storm boots, accuracy is not too important. Some jobs, however, such as mending or re-covering luggage or books, call for meticulous matching before you bring any two surfaces into contact. Still, oven if you botch a job, all is not lost.

Trouble shooting. If you have misjoined surfaces or want to break a joint for some other reason, use a solvent. This can be either lacquer thinner or the solvent sold by the maker of the cement.

Sometimes you can apply the solvent with a small brush. A more efficient method is to squirt it from an oil can run along the joint, peeling back the

material as you go.

If you fail to get a good bond in some areas, or there are indications that the joint isn't bonding as it should, you may have let the cement become too dry. Here the remedy is less drastic. You can reactivate the cement with heat. Use a heat lamp or an ordinary light bulb—never flame. Warm the area, then press the two materials together. Hold or weight them until they have cooled. Note: With most cements, this must be done within the first three days.

To clean applicators or brushes, use the same thinner or solvent suggested for breaking joints. Turpentine, kerosene and gasoline won't touch contact cement. And keep the stuff and its solvent off painted and varnished surfaces and asphalt tile. It will soften and mar

them just as lacquer will.

When working with contact cement take all the care that you would in using lacquers and cleaning fluids. It is inflammable. Work in a well-ventilated area and don't breathe the fumes for prolonged periods. Keep the can tightly closed when you are not using it.

Contact cement is put out under half a dozen or so brand names. Which one you get at the store doesn't matter much. They are all about the same, do the same jobs, are applied the same way.

Use the adhesive with care. Use it right. It will do a hundred jobs you'd never thought possible before, and it will lighten the work of many familiar ones.

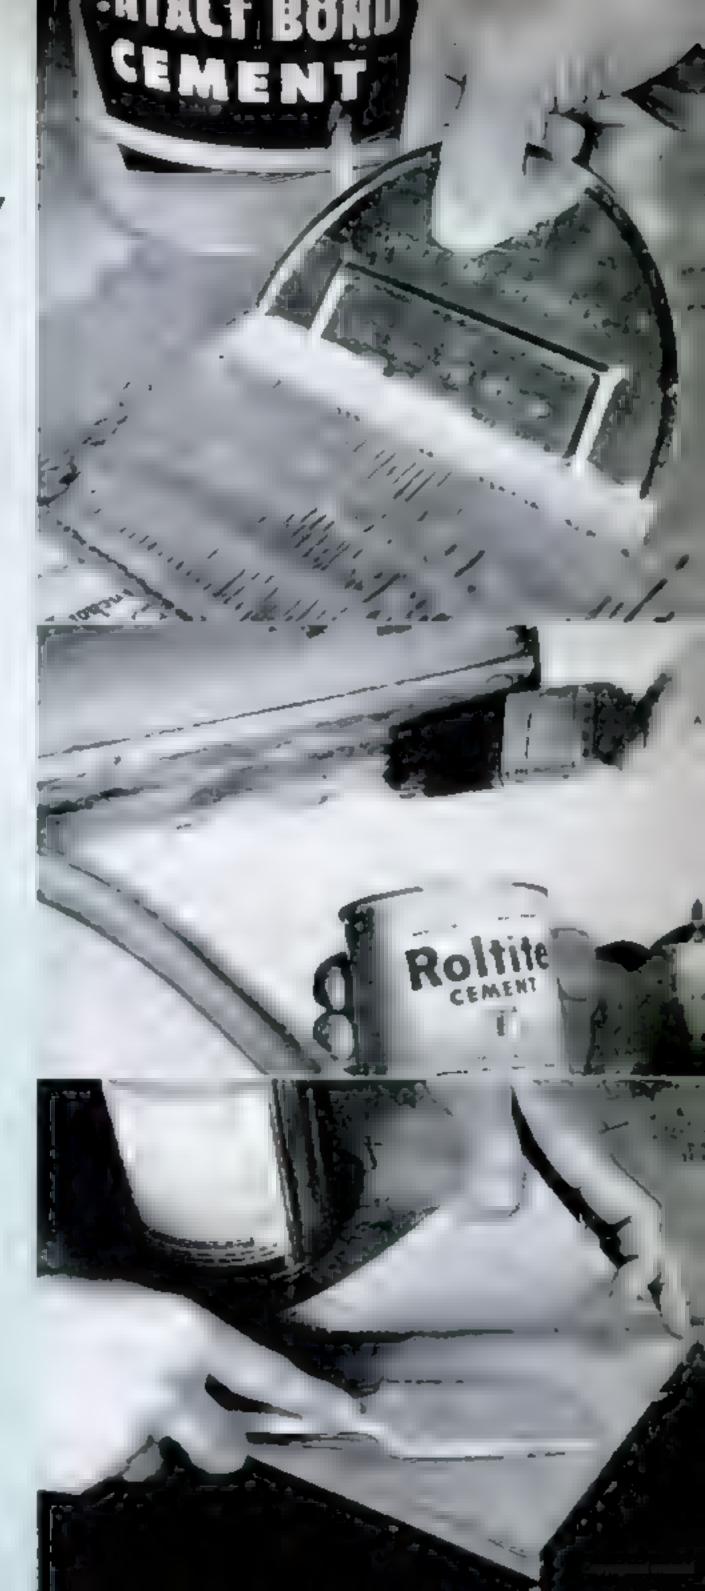

3 ways to apply contact cement

use a notched trower or special applicator to cover large areas with right amount of cement. Hold it with teeth 45 degrees to a non-porous surface, 90 degrees to a porous one, you can make a spreader by cutting about seven notches to the inch on one edge of a 6" sheet-metal square.

A PAINTERUSH is a good allaround applicator, as in this job of repairing loose weatherstripping. As in all cases, be sure both surfaces are clean and dry. Sandpaper the wood to remove any old glue or paint. Lay the cement on instead of brushing back and forth

for spreading contact cement over small areas or in places hard to get at, like this repair job on a loose corner. This homemade paddle has sawtooth notches in the end. It can also be used in much the same way as a trowel.

MARCH 1959 [79

5 Tips on Using Contact Cement

USE A ROLLING PIN to b ind large areas that are flat. Put plenty of weight on it as you roll it is best to complete the bonding as soon as the two surfaces have been joined, while the cement is still fresh. But you can let the cement dry and reactivate it with heat within several days.

sup sheets of wrapping paper are a great help in exactly positioning large surfaces. With the cement set, put the parts in place with the paper in between. Ship out the paper to give contact along approximately 2" of the end, Press firmly. Then pull out the rest of the paper.

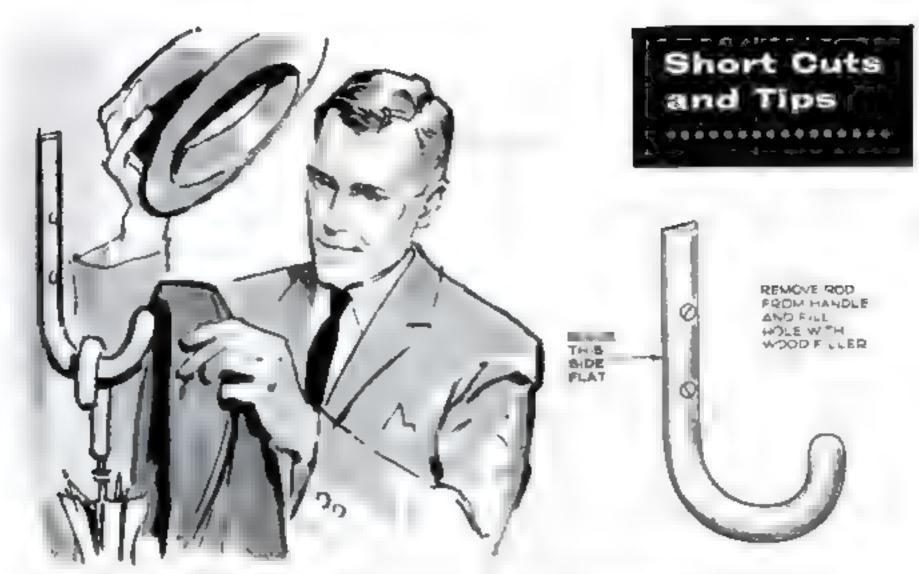

be used to bold surfaces apart when joining them. This method is particularly useful when repairing a corner like this one that has come loose. For large-scale laminating, it's best to work from one end, removing the dowels one at a time.

small work and irregular surfaces, and is fine for the edges of large areas. Any roller not more than 3" wide will do. Safest rule is to use both roller and hammer-and-block method on any areas that are difficult or call for a very firm bond.

NIQUE may be used anywhere. It is especially good for bonding narrow edging jobs. Hold the small block of softwood and tap it gently. Then move it along and hit it with the hammer until you have covered every inch.

Handle from Discarded Umbrella Hangs Clothing on Wall

AN OLD umbrella handle may be used to make an effective wall hanger for coats and a hat. Plane or rasp the side away from the hook so it will fit flat against the wall and drill for two wood screws. You need not paint the piece—umbrella handles usually have a fine finish that blends with woodwork.—Frank Shore, NYC.

Copy Holder for Typist

WITH a 10"-by-16" sheet of galvanized iron you can make a handy holder for a typist's copy. Bend a 4" or 5" rest on the long side. You will find a small alnico button magnet is strong enough to hold four or five thicknesses of paper.

—H. J. Gerber, Stillwater, Okla.

How to Anchor a Screw

Wood screws sometimes shake loose when the board into which they are driven is subjected to a great deal of vibration. You can lock them in place by drilling a small angled hole in the head and putting in a brad or small finishing nail.—R. J. De Cristoforo, Los Altos Hills, Cal.

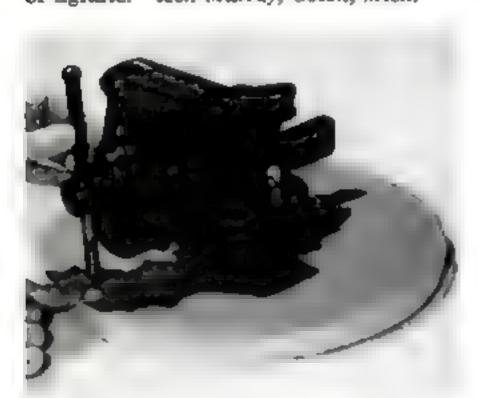

Picture Frames from Serving Trays

Those individual serving trays, 4¾" by 6¾", available in dime stores make excellent frames for small portraits, snapshots or postcards. You simply trim the pictures to fit and cement them in.

Wall hangers or stands to prop them on can be made from stiff cardboard and cemented to the back, or cut from a tin can and soldered.

—Arthur Trauffer, Council Bluffs, lowe.

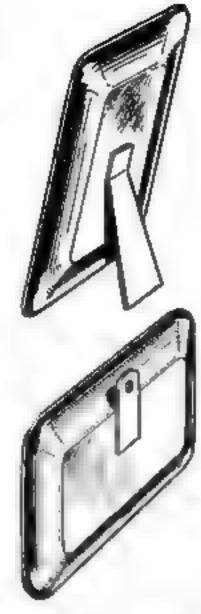

▶▶▶AN ICE cube inside a plastic vegetable bag will slow down the development of shadow areas in a print. Dip it into the solution and pass it over the darkening portions slowly. Don't move the tray or agitate.—Ken Murray, Colon, Mich.

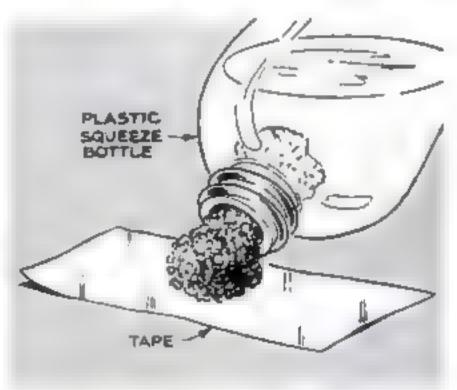

Portable Mount for Bench Vise

Ever wish you had a bench vise when working in another room in the house or in another part of the shop? You can make a light vise portable by mounting it on a sturdy wood or plywood disk. A blind hole near the rim will hold the screw handle while the vise is being carried.—Frank A. Javor, Newark, N.J.

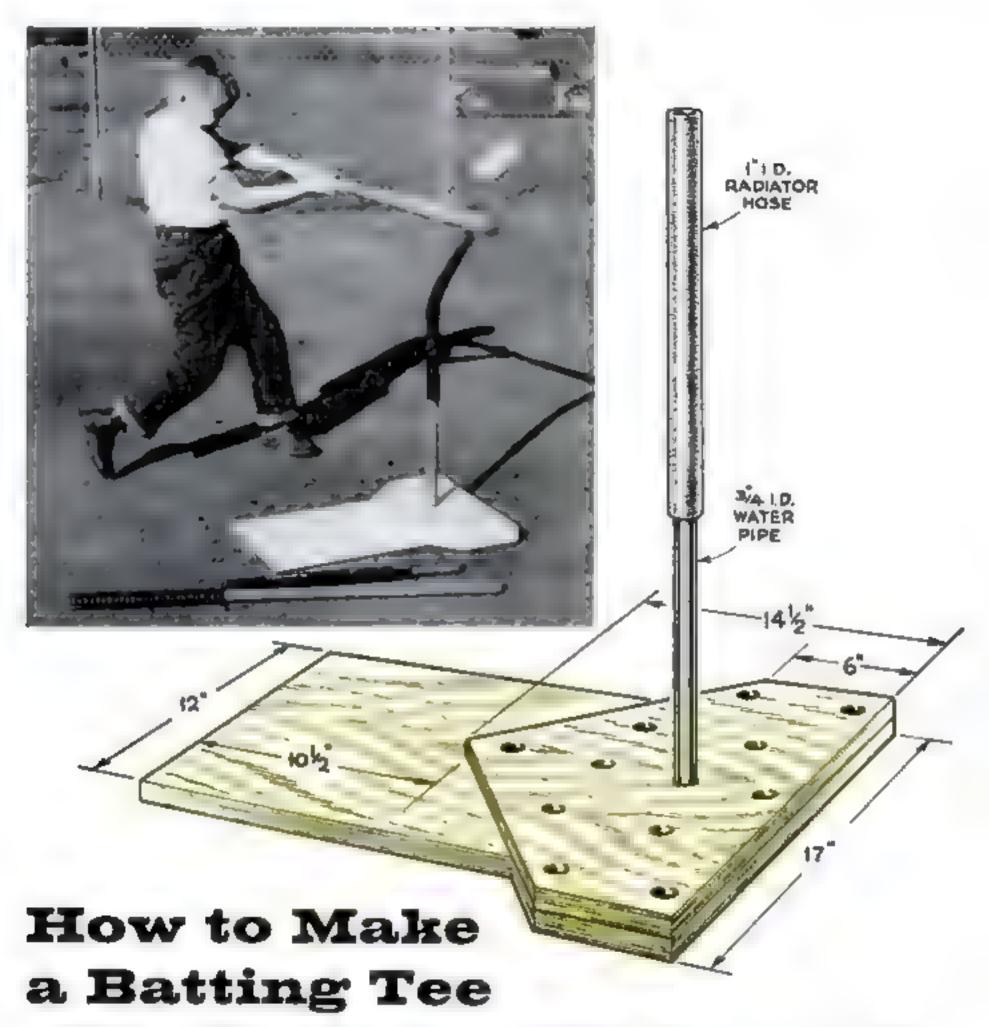

around, I put shingle stain on the outside of the concrete foundation blocks in my house. The color remains virtually unchanged after several years and has received compliments.—Robert Tyson, NYC.

Dampening Gummed Tape

If you don't like licking adhesive on tape, remove the top from a plastic squeeze bottle, fill with water, and stuff the neck with a cellulose or rubber sponge. Turn the bottle up, let the sponge soak, and you're in business. If it needs more water than it normally feeds—just squeeze.—Carl H. Betz, Philadelphia.

SHORT of a pitching machine, there's nothing that will give a budding batter the feel of the strike zone better than a batting tee.

The tee positions the ball where only a red-hot pitcher can put it, giving the boy a square crack at it every time, and eliminating the danger of wild pitches.

Tees are simply \(\frac{4}{3} \) pipe topped off with 1" radiator hose. Extend the hose at least 8" above the pipe to allow it to flex when hit and to take the sting out of low swings. Use different pipe lengths to vary the ball height within the strike zone between the boy's knees and his shoulders. Three tees with overall heights

of 22", 30" and 38" make a good allaround set.

Cut home plate from 3/4" plywood and mount it on a broad plywood base. Drill 12 1½" holes in the plate for positioning the tee close to the batter or near the "outside" zone. Using these holes in combination with the three tee heights makes it possible to place the ball in 36 different strike positions.

In bad weather, the tee can be placed in front of an old blanket hung from the basement joists to stop the ball. Weight the base with a bucket of sand to keep it from sliding on the smooth floor.—

R. Mathiot, Lake Grove, Ore.

The Case for Buying an Older House

Chosen wisely, it offers more per dollar than a new house. Latest FHA rules make buying easier

By John L. Springer

ODAY, shoppers are going for secondhand houses at a rate unequalled since the '30s. In such representative cities as Los Angeles, Detroit, Houston, Atlanta, Denver and San Francisco, sales were up 300 percent in 1958.

Much of the boom results from the big assist given this market by the Federal Housing Administration. Formerly many families had to buy new homes because they couldn't make the down payments needed for old ones. Now, thanks to a broadened FHA base, low initial payments and interest rates apply to all acceptable houses regardless of age.

This points up the question: How good a value is the older dwelling? The best, say the experts, provided you choose wisely. Consider these advantages:

You get more space for your money. As FHA Commissioner Norman P. Mason puts it: "Today's buyer wants a bigger package. His family is larger, and the current trend is to make the home the center of more and more activities."

Dozens of surveys bear him out. Most modern young couples want at least three bedrooms, two baths, a spacious kitchen and a family room. Few, however, can afford a new house with these features,

The used house often solves the problem. Brokers in many areas report that if you're willing to settle for a 25-yearold, you'll get at least twice as much floor space for your dollar.

Your home is ready to be lived in.

After being swept off his feet by a set of blueprints or a sample house in a new development, the impulse buyer is often shocked at the many "extras" he needs.

The used property generally offers these improvements. Of course you'll have to replace and repair some items. But a survey by the Allied Home Owners' Association of Roslyn, N.Y., indicates that you'll still come out ahead. Newhouse buyers, it revealed, spend an average of \$250 a year for inside and outside improvements, plus \$85 for repairs—a total of \$335. Used-house buyers, on the other hand, spend \$150 annually for repairs, but a negligible amount for improvements.

Taxes are more likely to be stable. In older communities there's often no room for further large-scale building. The needed roads are in; established schools and fire and police protection are adequate. In a new tract, community

Any good secondhand house gives you four bonuses missing with

IT HAS MORE AND BIGGER ROOMS, Labor and materials cost much less when it was built.

VALUABLE IMPROVEMENTS ARE "THROWN IN." A lawn, trees, fencing, etc., are new-house extras.

improvements can boost taxes so high that home owners may be kept broke paying them.

You don't buy a pig in a poke. It's easy to close your eyes to the possible shortcomings of a new house smelling beguingly of fresh plaster, paint and

wood shavings. If a dwelling has been up a few years, however, its structural defects are obvious. You can go from basement to attic and note the condition of the foundation, walls, ceilings, roofing, plumbing and heating plant.

This holds for the neighborhood as

most new ones. They're as important as the purchase price

THE NEIGHBORHOOD IS SETTLED. Services are established; land values and taxes are stable.

UPDATING'S EASIER. A smaller mortgage leaves cash for gradual replacement of old equipment.

well. Before you buy an older house, you'll see what's on the next block, where the bus line runs, and how far you'll be from schools, churches and shops, You'll be able to tell whether the street is noisy or quiet, and know if the neighborhood

is on the upgrade or the skids.

On the other hand, new homes are often built in open areas. A developer may snatch up the remainder of that vacant land and cover it with low-price houses that reduce the value of the better properties sharply. Or a new home may give you a vista of distant hills; then suddenly the view is ripped apart for an unsightly business or industrial setup.

You may get a better-built home. While experts argue this point, many prewar houses were probably built more

The Easy Way to Paper a Ceiling

\70U can paper a ceiling like a pro I with this British invention. Two crutch-tipped dowel rods jammed between floor and ceiling support a paperholding tray. As the paperhanger brushes on the paper, the tray is moved by pulling down the upper dowel to depress a spring.

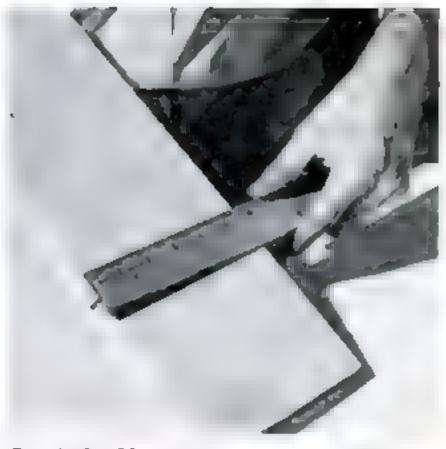

carefully than modern ones. Wages were less than half what they are now, and workers were given more time for details. Because the cost of materials was also lower, a higher percentage of the older structures were built with better lumber.

You're in a good bargaining position. Real-estate brokers agree that the owner of an older house will almost always come down in his price. There are two reasons: He is usually anxious to unload for some special reason and will nibble at a cut-rate offer; 2) Because inflation has pushed the prices of all houses upward in the past 15 years, he can probably sell at a few thousand under his asking price and atill profit. The new-house builder doesn't have this bargaining leeway, because he rarely stands to make more than a 10- or 15-percent profit above actual construction costs.

Updating possibilities. Many a handyman has latched onto a run-down bargain, moved in, and repaired and modernized it—then resold at a substantial profit. More important to the average buyer, however, is the fact that it's sometimes easier to keep a used house up to date than a new one. When you buy the latter you expect (or may be forced) to stay with all of its equipment for many years. But advances in home facilities are being made so fast that what's modern today is almost certain to be old hat in 10 years.

The pitfalls to avoid. Admittedly, buying a used house has its risks. Unless you're a real judge of construction you should never sign on the dotted line without first having the property gone over by a trained appraiser. For about \$25 he will go from cellar to attic, looking for sagging floor joists, out-of-line doors, hidden water marks and other signs that may indicate serious defects. It's also important to get his opinion if you intend to go in for extensive remodeling. Some old houses are built in such a way that they can't be modernized economically.

Finally, avoid buying into a rapidly declining neighborhood. Beware when big, old surrounding houses are being turned into apartments or rooming places, or stores or small factories are moving in. Unkept lawns and shabby house maintenance are other warning signs. No matter how attractive an individual property may be, its value will nosedive under these conditions. END

Curtain Hook Backstops Ruler

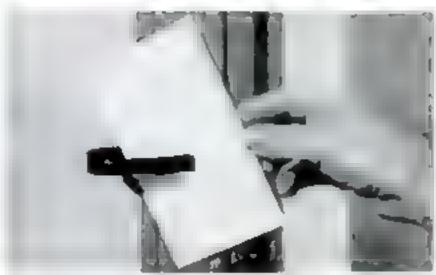

Measuring stock is faster and more accurate with an end stop on a wooden shop ruler. The stop is an L-hook, of the kind that is used to hold up curtain rods. Drill a pilot hole for the hook first to avoid splitting the wood.

Improvised Carpenter's Level

You can level work with a square and a plumb line if the proper tool isn't handy. Set the square, blade upward, on the piece to be leveled and hang a plumb line from the blade's topmost outside corner. The piece will be level when the plumb line and the blade edge are exactly parallel to each other.

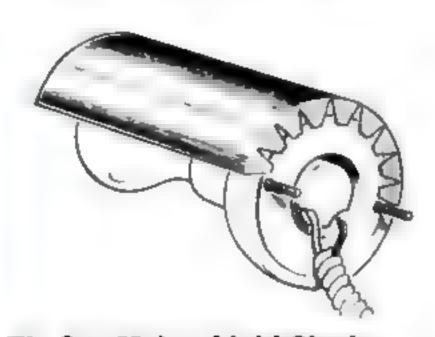

Letter Holder Reminds of Mail

Do you often write letters, then forget to take them out to a mail box? Try this. Slip one of a pair of cyclist trouser-leg clips behind the front door frame and use it to hold letters. You'll surely see it when going out.—Ken Murray, Colon, Mich.

WHEN I can't get hold of exactly the right size faucet washer, I grind down an oversized fiber one. I cut the head off a nail that fits the washer hole tightly, chuck the nail in a drill and grind the washer on tacked-down sandpaper.—

James Miller, Muskogee, Okla.

Tin Can Makes Light Shade

Tin cans make handy shades for outside wall lights of the kind mounted on porcelain bases. Find a can of slightly larger diameter than the porcelain receptacle. Then trim it and insert it between socket and light bulb, as shown. Tighten the receptacle and paint the shade.—

R. B. Layton, Jackson, Miss.

The Box That Won't

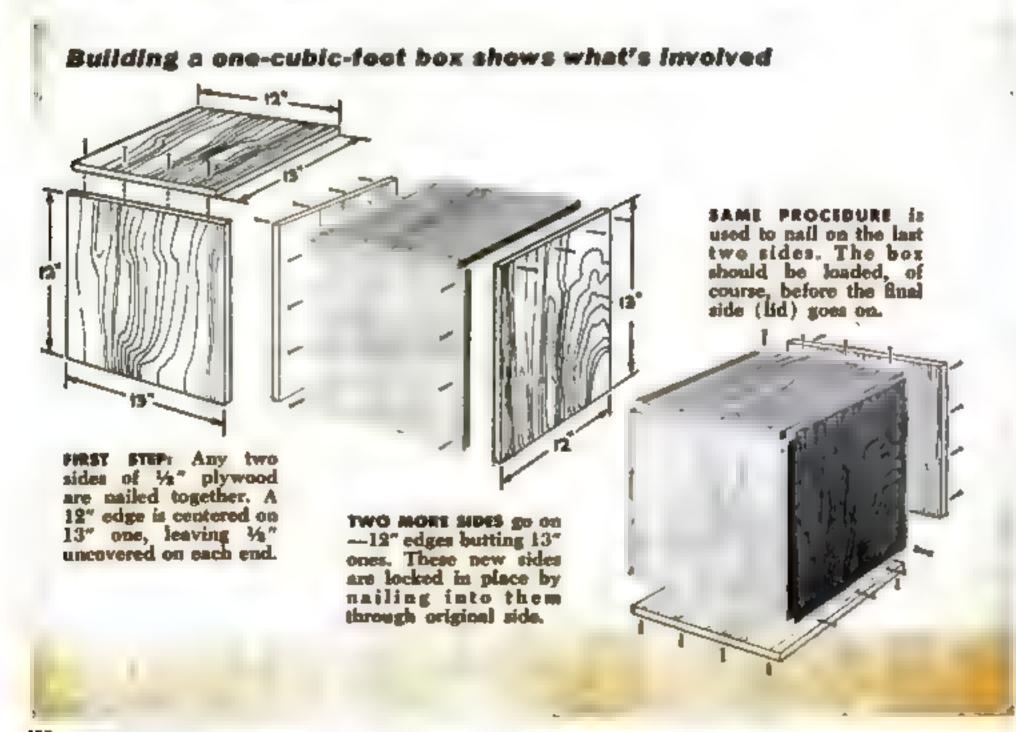

FOR SHIPPING you can't beat a box like this one. Its lap joints interlock. Each set of nails holds one side down and helps brace an adjoining side. All six sides are the same size.

You should know the secrets of this box. Nail it together and it stays that way. The weight of its contents never pulls it apart. Ship things in it with complete assurance that it will all get there if any of it does; for the box will not (because it cannot) pop open—no matter how it's bounced around.

To make it, you need no screws, no steel braces or finger-cutting straps or expensive corners—just good old nails and six properly cut pieces of wood, one for each side. Nothing else. Plywood is probably best, but any wood will do.

The secret is in the nailing procedure. This is a vicious circle that goes, side by side, right around the box's six sides (or five, if it's a lidless variety). Each nail works two ways—vertically and sideways. The nails that hold any side on also hold the nail-onto side in.

Come Apart By L. R. Sandes

How's that again? Well, maybe you'd better pore over the accompanying drawings to see just what it is that we are talking about.

What's it good for? Lots of things. For one, it's unsurpassed for mailing gifts and goodies that you want to give perfect posteriors.

fect protection.

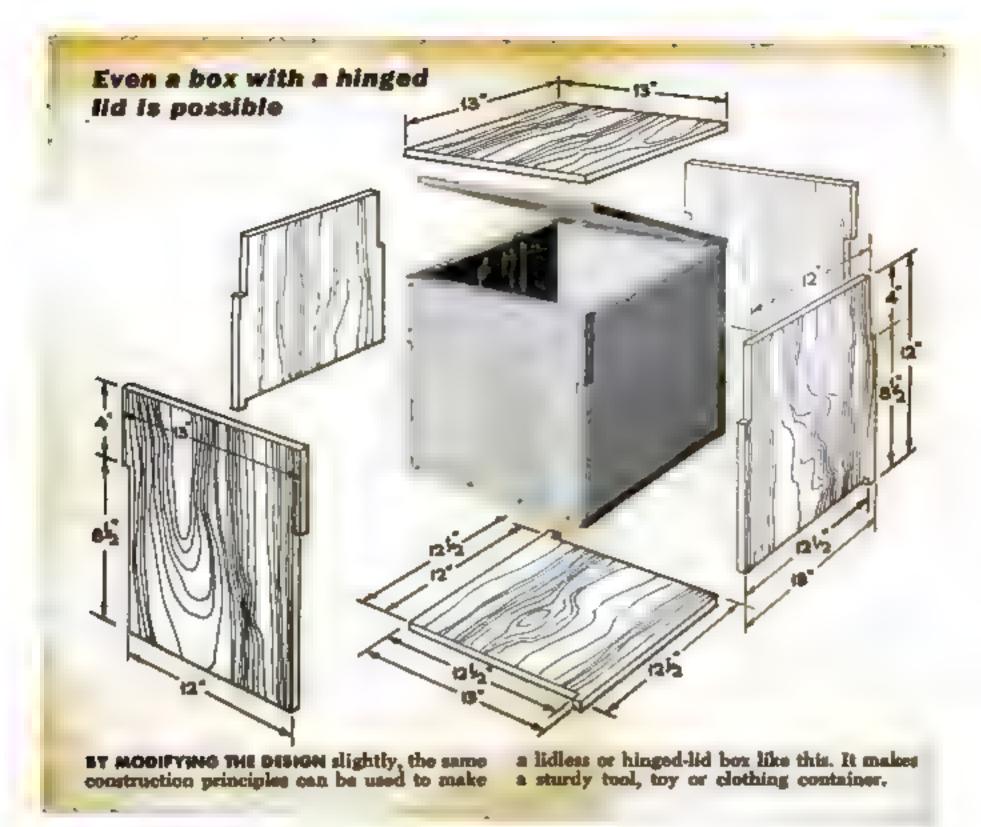

Send that boy who is overseas a box from home that will contain everything when it reaches him that it did when you sent it—for a change. I know; I've been there. It's a long way across the Atlantic, and longer still across the Pacific; and it's not difficult to imagine the amount of punishment any container is subjected to in either direction.

Hunters will find the box useful for storing ammunition from season to season. It would also come in handy for packaging small, easily lost household items and workshop tools for that crosscountry, or even cross-town, move. For camping you want a container that will contain your essentials until you decide otherwise. This is it.

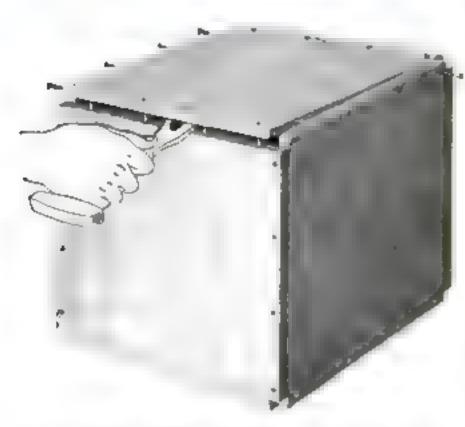

A cube shape is best for two reasons—economy and strength. Excluding curved-wall containers such as barrels and spherical water tanks, you get more cubic space inside for the same amount of containing surface if the container is an equilateral cube, than you do from any other shape of box. Due to the interlocking design, greatest over-all hold-together tightness is obtained if all 12 edges are of nearly equal length, for then the strain is equalized on all six sides.

Sometimes a cube is impractical, however. You would not, for instance, want to ship a typewriter in one. In such cases the container should be built to fit its

Screws make box easy to open

USE SCREWS INSTEAD OF NAILS on two of the opposite edges as shown here to make the box easy to open. With the two rows of screws removed, it's simple to pry up the edge.

box up to one foot square; any larger dimensions and this thickness of plywood will have too much spring in it to be reliable. It really works, too. I built eight boxes a few months ago and shipped my per-

load regardless of other considerations.

The same design, however, would apply even to a flattened box for a portable typewriter or a neatly folded fur coat or

Any size will do, but the smaller the

better. And the bigger you make it, if it must be big, the heavier should be the wood. Half-inch plywood does well for a

sonal effects in them from an Aleutian island to Los Angeles. The 4,000-mile trip took two months.

man's suit.

When I got the boxes, not one seam had split or pulled apart, every nail was tight, nothing inside was broken. Papers and books weren't even damp—I had kept the tolerances quite close. The boxes couldn't have had a fairer test. END

90 POPULAR SCIENCE

Hose Grips Fishing Pole

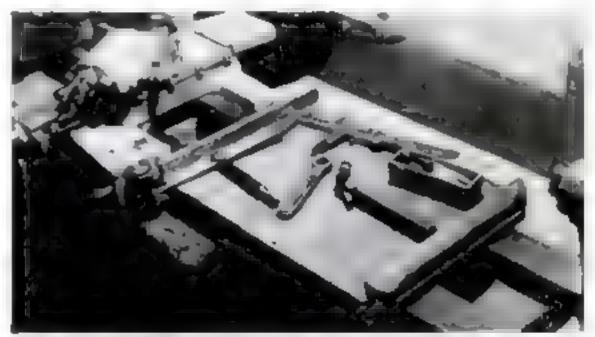

SHORT pieces cut from auto-radiator hose will bundle together sections of a bamboo fishing pole for easy toting and storage.

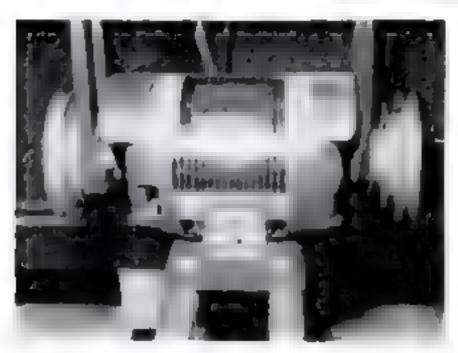

You need just slit the pieces of hose lengthwise and slip them around the sections of fishing pole.—
Norman Jackson, Milwaukee.

Sliding Tool Tray Protects Lathe

KEEP lathe ways free of nicks by parking your tools on a plywood tray. Screw a wood strip under the center of the tray to fit between the ways and keep it from sliding off. Nail quarter-round molding at two ends of the tray—or all around the edges—to fence in the tools.

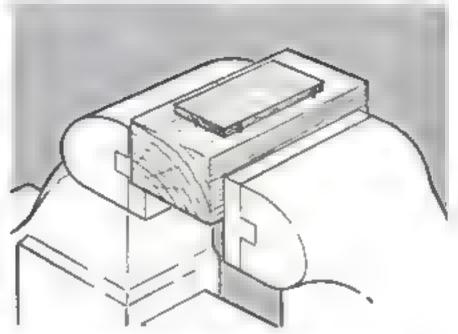

—R. E. Platt, Feastville, Pa.

Motor Wears Dust Deflectors

Two small pieces of sheet aluminum cut to size, bent and secured to a shop motor with strips of masking tape will keep sawdust from plugging the housing vents.—William F. Hughes, Helena, Mont.

Gripping Thin Stock in a Vise

Thin stock is hard to grip in a vise, but not if you mount it firmly on a wood block. You can do this with small headless nails driven in close to the sides.

—Federico Strasser, Santiago, Chile.

Short Cuts and Tips

Fire Deflector Protects Building

This water-curtain attachment was developed by firemen of Harrisonville, Mo., to keep flames from leaping from one building to another.

It was cut from ½" boiler plate and connected to the hose nozzle. There it deflects the stream, forming a fan-shaped curtain.—Don Hoffman, Kansas City, Mo.

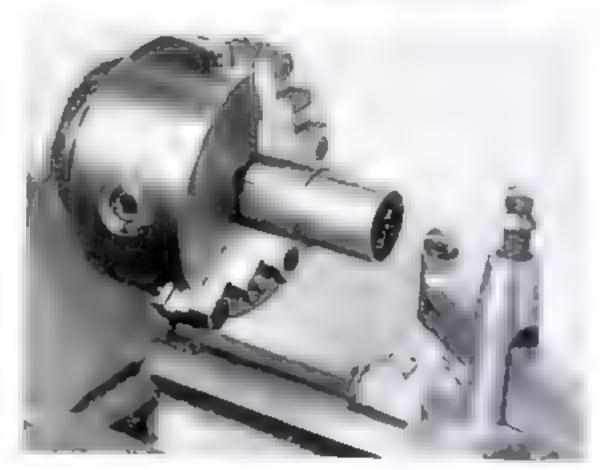

Magnets Make Film Washing Easy

A CONVENIENT way to wash roll film is to clamp the ends to the side of the tray with a small, powerful alnico magnet. This keeps the frames separated for quick washing free from scratches. If you have a quantity to wash, try this scheme in a bathtub; it allows space for stretching the rolls full length.—O. A. Nelson, Seattle, Wash.

Sleeve Holds Tubing in Lathe

Thin-wall tubing is hard to chuck for machining in a lathe because of the danger of distortion or crushing. An effective method is with a length of seamless steel tubing used as a sleeve.

Select a piece that will slip over the work and alit it lengthwise so it can be squeezed. It need not be a close fit; even if considerably larger, it will close accurately if a large enough slot is cut.—H. J. Gerber, Stillwater, Okla.

Empty Boat Tows Water Skier

Pulling on the tow lines steers it. Orders through a plastic air hose start it and stop it

By Wesley S. Griswold

NE of the cleverest pleasure boats in the U.S. carries no passengers. It's a fast-moving midget outboard, piloted remotely by a water skier who rides 35 feet astern from a towline.

Called Ski Horse, the 200-lb. craft measures only seven feet long and 3½ feet wide. A 20-hp, outboard motor supplies enough power to haul a skier around at speeds up to 25 m p.h.

Lee S. Simpson of Fresno, Cal., devel-

oped the unmanned outboard so he could water-ski without depending on his wife to crew the family speedboat. The 38-year-old inventor launches Ski Horse (it takes only a few minutes) and pilots it without help.

A pull on the starter handle fires the engine in its hatch-covered well. Shoving the boat away from him to straighten out the control lines, Simpson covers a little hole in the tow handle with his thumb. The Ski Horse shifts into gear, revs up and takes off. It runs at full throttle as long as that hole remains covered. If the hole is uncovered, as it would be after a spill, the motor idles down and shifts into neutral.

"You steer the boat just the way you

would drive a horse," explains Simpson, a staff supervisor for Pacific Telephone & Telegraph Co. It responds to the tow ropes far faster than a sensitive nag reacts

to a tug on the reins.

The tow lines are clipped to the ends of a single rope that runs over sheaves in the stern and makes several turns around a vertical drum atop the rudder post. Stops prevent the rudder from swinging more than 30 degrees right or left. A spring pulls the rudder back to straight-ahead position when the skier is not actively steering.

Most ingenious feature of the boat is the system of pneumatic controls that shift the gears and operate the throttle. As the diagram shows, a little exhaust gas bled from the engine is stored under pressure in a tank. A relatively highpressure line fed by the tank does the actual work. A similar low-pressure line, terminating at the hole in the tow handle, exercises control.

When the skier covers the hole with his thumb, air pressure quickly builds up in the control line. This opens a relay valve, putting the high-pressure air to work.

High-pressure air is valved first to the piston that shifts gears, then to the piston that opens the throttle. Thus gears are shifted before the engine speeds up. Less than a minute after the skier blocks the air hole, the craft snorts away full tilt.

Uncovering the air hole drops pressure in the control line, closing the relay valve. Now pressure is vented from the pistons in reverse order—first the throttle piston idles the engine, then the gearshift piston puts it into neutral.

The Ski Horse meanwhile slides to a full stop in just a few feet. As its inventor says, "It waits right there for the driver

to recover the reins."

Would Ski Horse run wild if a kink trapped air in the plastic hose to the tow board? This has never happened in hundreds of trial runs. Simpson doesn't think it ever will and shows why. Disconnecting the plastic tubing from the boat, he pinches it double and blows air through despite the restriction.

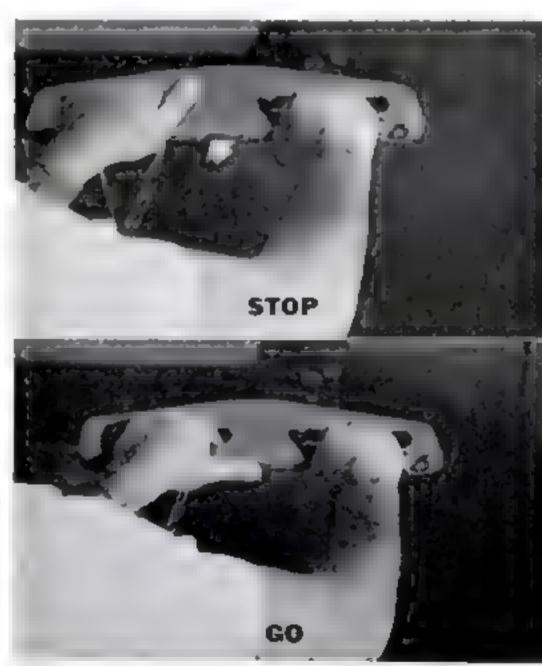

However, to make control absolutely certain, he suggests one of two safety devices. The first, described in his patent application, would switch off the engine whenever excessive water pressure builds up against a pick-up arm under the boat. This would happen at once, of course, if the Ski Horse ran off at full throttle without a load. A second device would ground the ignition whenever the engine developed excessive r.p.m.

Within two days of conceiving the idea for Ski Horse, Simpson started work on the plans. A natural mechanic, he had no trouble building the control system. Designing the hull was a gamble, but the boat handled perfectly from the start. It leaps right out of the water when crossing another boat's wake at full speed, but it has always landed safely.

The hull is of 1/4-inch plywood, and Simpson formed the hatch of fiber-glass, with a bulge in it to make room for the outboard power head. He reinforced the hull bottom with a layer of fiber-glass. Ski Horse, minus the motor, cost less

than \$100 to build.

Though he's willing to sell the patent rights, Simpson has no intention of manufacturing Ski Horses. He is, however, working up a set of build-it-yourself plans for the boat, They will sell for \$15.

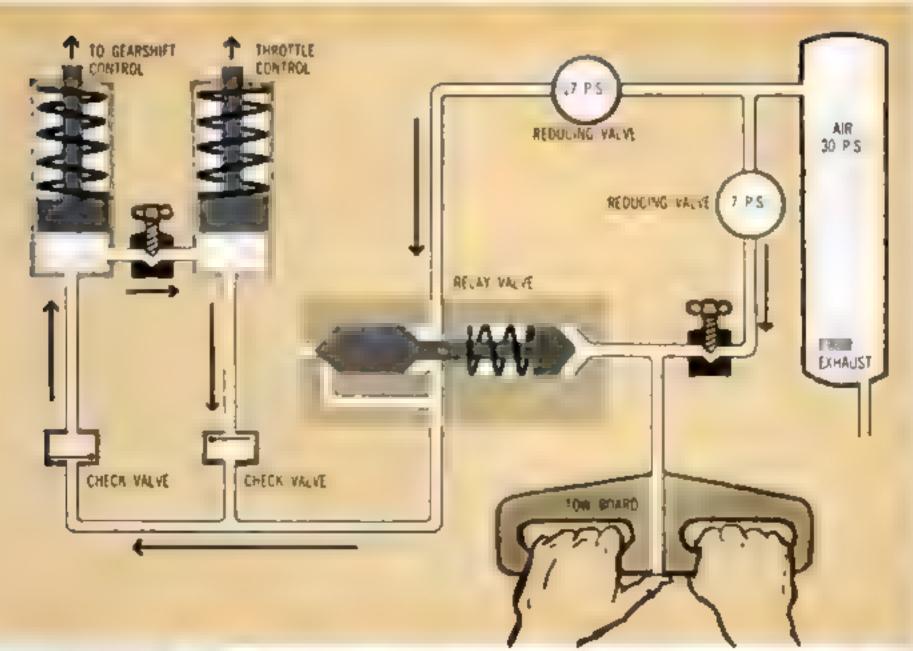

GEARSHIFT AND THROTTLE are controlled simultaneously by covering or uncovering an air hole in the tow board's rear edge. The boat moves only while the skier's thumb blocks the hole.

WITH HATCH OFF, outboard motor (a Mercury Mark 25) and controls look like this from the bow. Only major change made in the 75-lb. engine was to shorten its propeller shaft.

LAUNCHING THE SKI HORSE takes Lee Simpson, its inventor, just a few immutes. He backs a 100-lb, homemade trailer into the water, floats it off and attaches the control lines.

ENGINE-CONTROL SYSTEM uses part of the engine exhaust. Stored in a tank, it supplies one low- and one high-pressure air line. Low-pressure line, ending at the tow board, controls a relay valve that opens and closes the highpressure line. The high-pressure line does the actual work of moving pistons connected to the engine's gearshift and throttle.

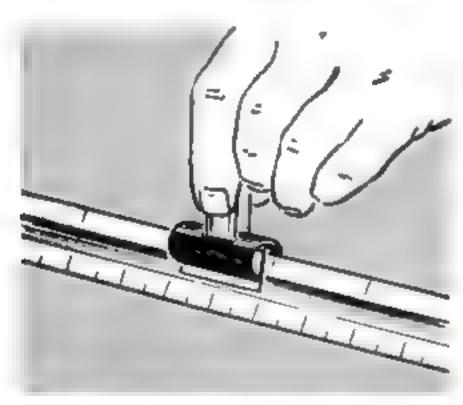

Easy Way to Make Model-Boat Masts

I SIMPLIFIED the chore of making model-boat masts for my son by showing him how to chuck one end of a dowel in the drill press, the other end turning in a hole bored for a loose fit in a short length of scrap board clamped to the table.

With the belt set to give slow speed, he now shapes the mast with course sand-paper and smooths it with finer grits.—R. J. DeCristoforo, Los Altos Hills, Cal.

▶▶▶BEFORE handling wood filler, I put a piece of plastic tape on a fingertip. I can then press filler into cracks and nail holes without having it stick to my finger.—Frank Bayak, Iselin, N. J. ►►►NEXT time you cut linoleum, have a bowl of soap or detergent suds handy and dip the shears or knife occasionally. This keeps the asphalt backing from sticking to the blade, makes cutting easier.

Handle for Triangular Rule

A SPRING clip on a triangular scale rule can eliminate the irritation of that repeated search for the scale you're working with. Just snap the clip over the edge opposite the wanted scale. Now, any time you pick up the rule you have the right scale, and the clip serves as a handle.—R. Mathia, Lake Grove, Ore.

Data File in Snapshot Book

If you have to refer often to a variety of data such as that required by draftsmen or machinists, try keeping notes in a small snapshot book of the kind available in dime stores. Type the information on small cards and insert them in the plastic envelopes where they can be read and will remain clean.—C. C. Cooley, Detroit.

A Message Center for the Kitchen

THIS busy center in the home of Phil Harris and Alice Fave blends with other redwood in the room.

Notes are chalked on a blackboard framed in redwood nailed to the wall. Storage shelves in the phone stand accommodate the toaster and other kitchen equipment.

A clever assembly procedure conceals all nails:

First the lower uprights were nailed to the bottom shelf from below; then two base forms, separated by 3/4" spacers, were nailed to the underside of the shelf.

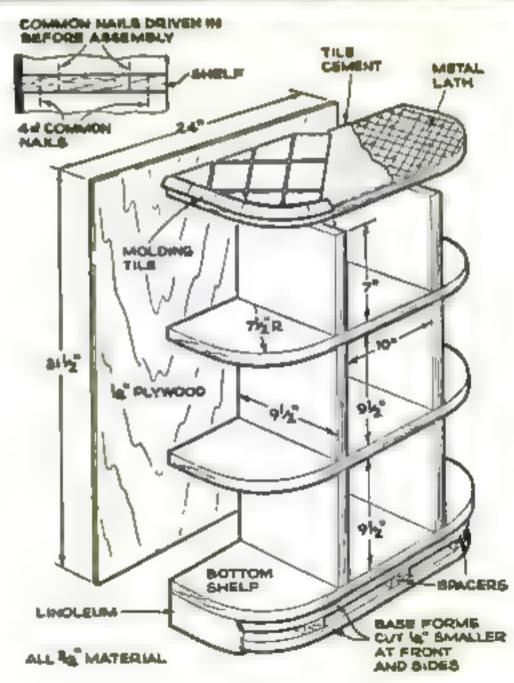

Next (here's the trick) nails were driven through the underside of the first intermediate shelf and left to protrude above it. This shelf was nailed over the lower uprights and the intermediate uprights driven down on the protruding nails. The next shelf and uprights were installed in the same manner, and the top was nailed to the top uprights.

After sealing the top to prevent warping, metal lath was nailed over it, and the top tiles pressed into tale cement spread over the lath. Molding tiles were cut into short segments to fit around the curved edges.

A natural finish was ap-

plied, and the base was covered with a strip of the linoleum used on the floor.-Hi Sibley, Nuevo, Cal.

Making Neon Test Light More Useful

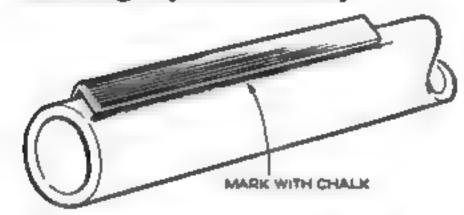

WITH a battery clamp or alligator clip on one or both probes, a neon tester can be hooked into circuits without being held.

This frees your hands for working at a distance or in tight places where it is hard to keep track of both probes.

—Richard Hanscom, Elmhurst, Ill.

Marking Pipe Made Easy

For a time and trouble saver when marking lateral lines on pipe, use a piece of angle iron as a straightedge and mark the lines with chalk.

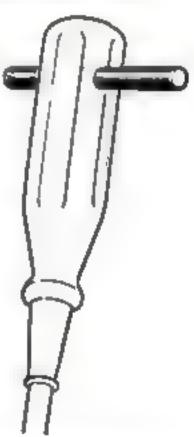

Because it has two edges, the angle iron will lie true. For long lines you simply move the iron along the pipe, aligning with the end of the line already marked.—John Krill, North Lima, Ohio.

Better Grip for Screwdriver

INSERT a 3/8" steel rod through a hole drilled 3/4" from the end of the handle of your largest acrewdriver, to provide extra grip. With it you can turn a acrew tighter than with an ordinary handle.

It also makes it easier to remove a stubborn screw. Cut the rod so it will extend 11/4" on each side of the handle.

—John Mihalick, East Liverpool, Ohio.

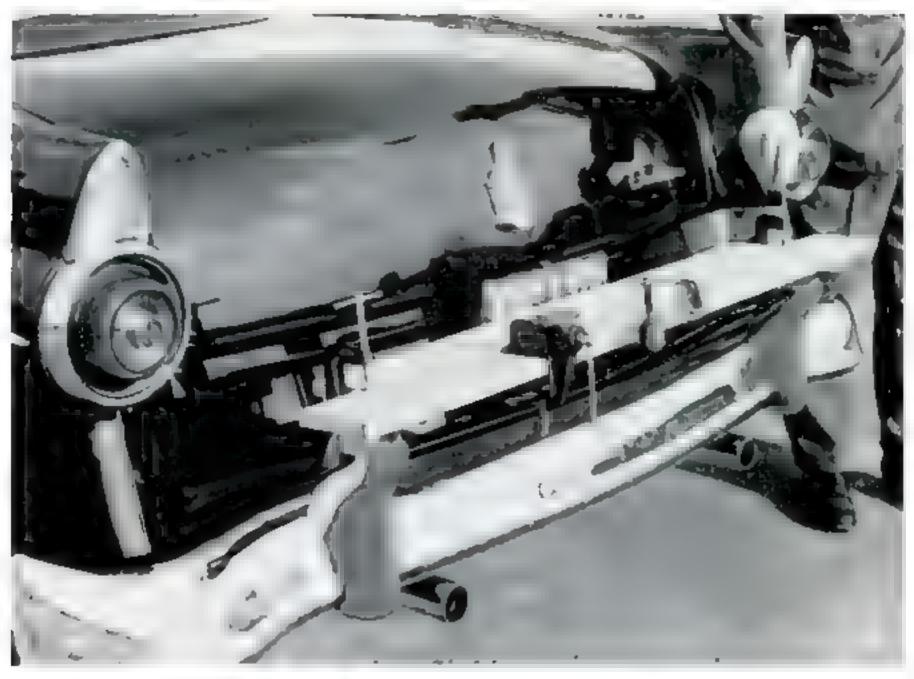

Ruler Helps Saw Equally Spaced Slots

No NEED to lay out a number of slots, such as those to hold separators in a record cabinet

Instead, attach a ruler to the work with overlapping tack heads. Read the graduations against the side edge of the miter gauge as the work is moved to cut each slot.—H. J. Gerber, Stillwater, Okla.

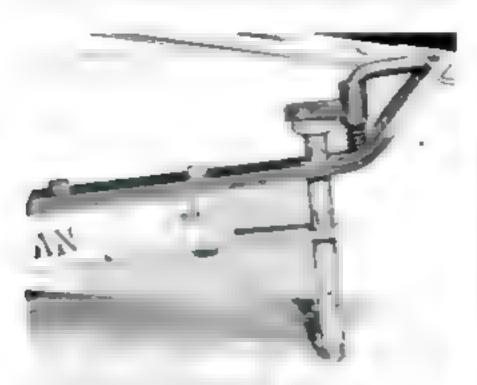

Bumper Workbench for Back-Yard Car Repairs

WHEN I'm doing car repairs out in the open, a 4' length of 8" shelving, clamped across the top of the rear bumper guards, supports a small vise and provides a clean

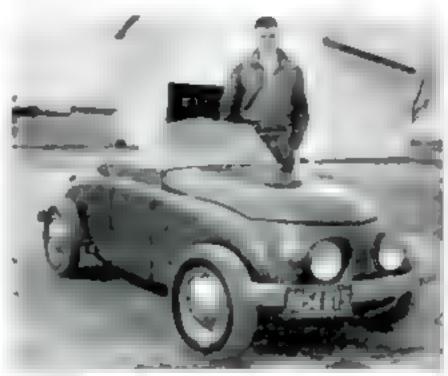

work area for laying out small parts. The shelving takes little space because it can be stored flat in the trunk of the car.

—O. A. Nelson, Seattle, Wash.

Keeper Holds Hitch Pin Secure

A SPRING-LOADED keeper holds this trailer hitch pin in place despite bumpy roads. Pressed down on its spring and flipped to one side, it releases the pin for easy unhitching. Swung into position over the head of the pin, it holds it firmly in place.—John Hartl, Cedar Rapids, Iowa.

It Used to Be a Crosley

A HUNDRED dollars and labor of love built this little hot rod from an old Crosley sedan. Modifications on the original body and frame created the outer effect, without changing the basic structure. Handling is excellent at speeds up to 65 m.p.h.—John H. Weber, Anchor, Ill.

Plug-In Parts Make a Clock-Radio

Module plug-in circuits and a printed circuit board make it almost impossible for even a beginner to go wrong in putting together this kit. All resistors and condensers are pre-assembled in stacked modules that plug into the circuit board Diagrams and instructions show you how. Tuned circuits are pre-aligned so that the set is ready to play as soon as it's assembled.

It has all the usual clockradio features. Appliances up to 1,800 watts can be controlled automatically. (The kit and the stereocontrol unit shown below are available by mail from Allied Radio, Chicago.)

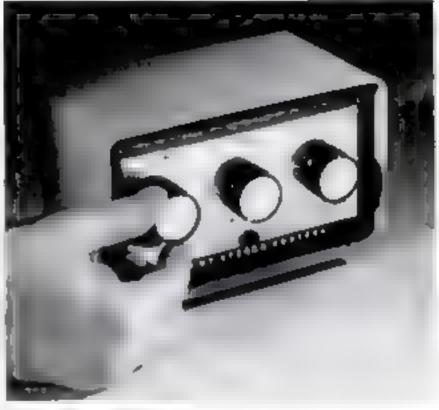

New Hi-Fi Unit Tailors Music to Your Taste

THE Audio Baton lets you become your own musical conductor, according to the makers of this unusual instrument. It gives you complete, octave by octave, control of the response of your hi-fi system. Unlike conventional tone controls that work only on the low or high frequencies, the Audio Baton gives you independent control of each octave over the entire audible range.

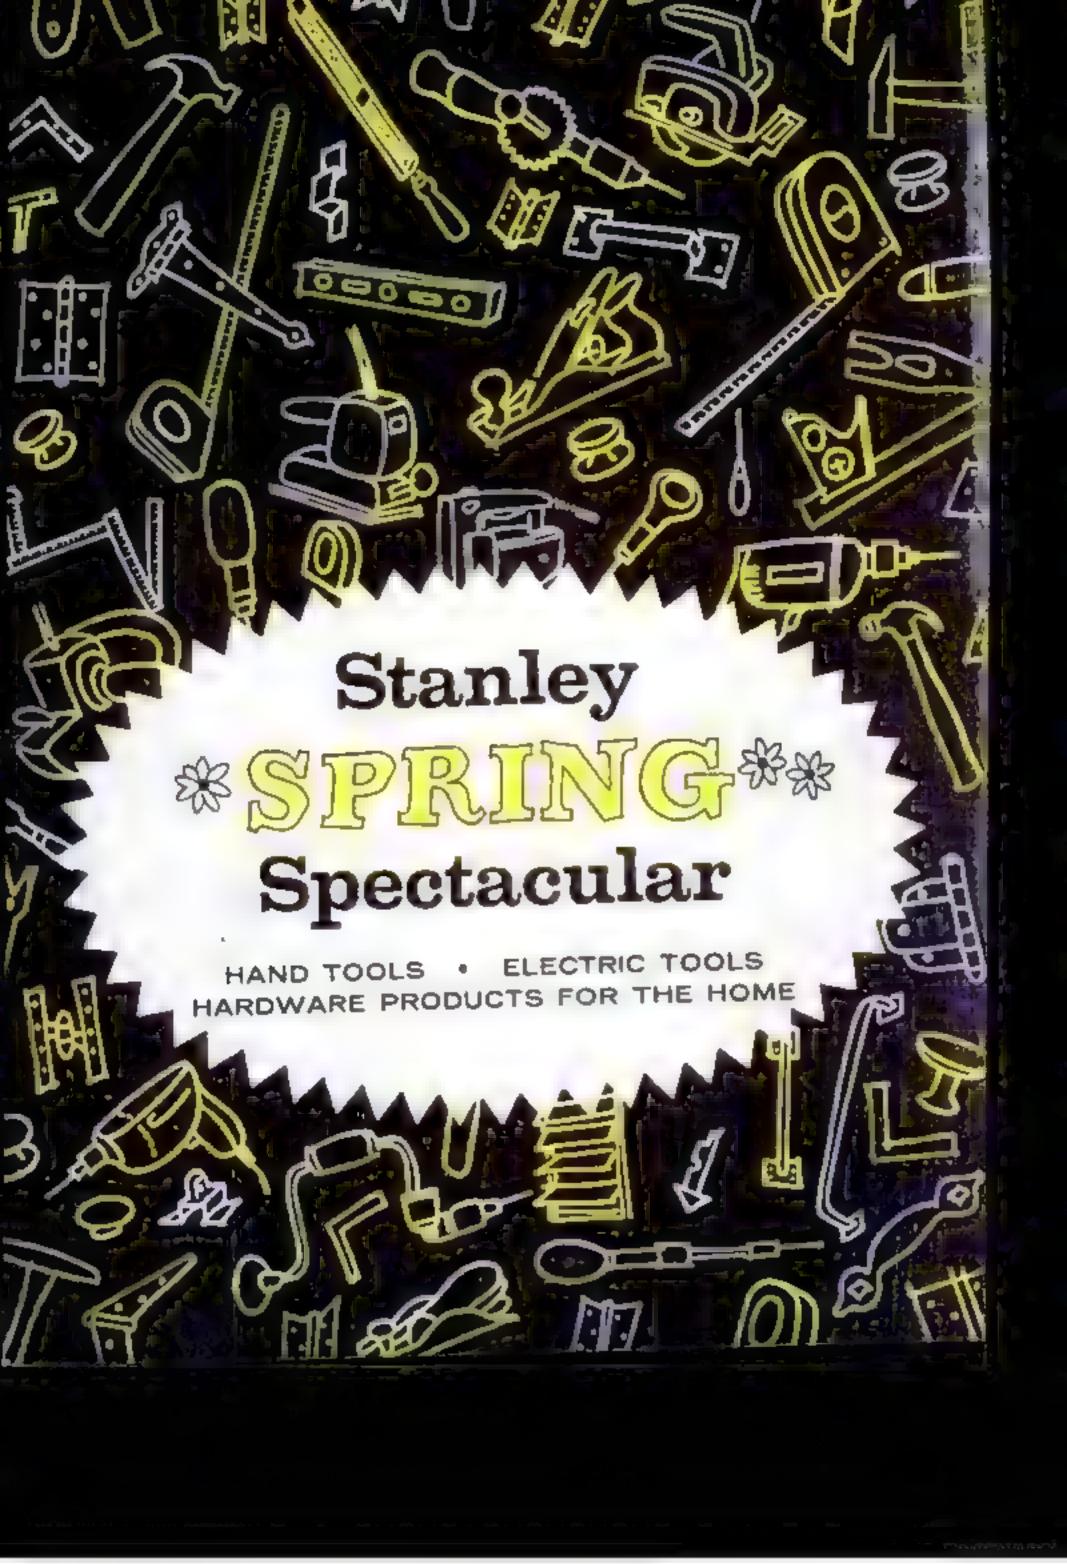

It is claimed that you can compensate for record deficiencies, room acoustics and individual hearing differences, as well as create your own special musical effects.

A unique feature is the visible response curve that lets you see at a glance the setting of each control in relation to all the others,

Kit Simplifies Stereo Conversion

Fremmo about how to add stereo to your hi-fi system? This stereo control unit connects between the output of the amplifiers and the loudspeakers. It provides centralized control of any stereo system using up to 20-watt amplifiers. No rewiring of amplifiers is needed. You get one-knob control of volume for both channels, balance control, phase-reverse switch and function selector. Instructions for use are included with the kit.

STANLEY HAND TOOLS..

STANLEY "SURFORM"®

No. 295 File-type. A fast, free-cutting tool. Never clogs. never needs adjustment. Hardwood handle, Afuminum body, 16%" ever-all, \$2.69

No. 295 WR File-type with new hulf-round blade for use on concave and circular surfaces. Body and handle same at No. 295 \$2.89

No. 295FC Fife-type with new fine-cut blade. Can be used on metal as well us wood and plastics. \$2.69

No. 296 Plane-type, for jobs requiring the control and foul of a plane. Aluminum body 10" long has hardwood handle and knob. \$3.69

No. 399 Pecket, Handy touch up tool for forming and trimming. Only 51/1" long, fits easily in pocket. \$1.49 No. 3998, Fine-cut blade for Stanley's new No. 399 Pocket Surform, 75¢

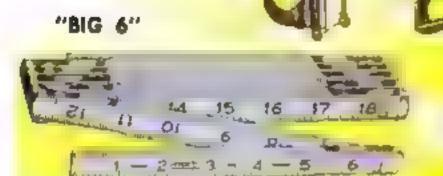

No. 2948. Flat regular cut for wood and composition. 984 No. 2988. Half-round regular cut for conceve and circular

Ma. 3945, Flat fine-cut for metal and other hard smooth surfaces \$8e

Me. 398B. Half-mund, fine-cut for irregular and concave metal forming, \$1.19

built better to build better with!

264

122 Combination Square, Belongs in every tool hit. Used on tri-square, mitre square, plumb, level, depth gauge, murking gauge and straight edge 12" lempered blade precision ground. Square and parallel graduated in 8ths, 16ths and 32nds. Has scriber and level vial in cast iron handle. \$3.49

312 Aleminum Lovel, Stordy, accurate, all purpose level. 2-5/16" x 1" x 24" with two double plumbs and one double level. Has replaceable protecting glasses, black and aluminum finish. \$8.50

#100 Refter Square. A basic tool for home construction, Body 24" x 2", tongue 16" x 1½". Polished finish. Oreduated in 16ths on face; 16ths, 12ths and 10ths on back, Refter lables on body. Supplied with bookiet on how to use. \$5,30

"Big 5" Folding Rule. New rugged 5" rule with 30% thicker sticks and permanently lubricated king-size joints that provide more strength and rigidity, \$2.00

264 Alemiaum Torpedo Lazel. Handy and Hightweight for all tradesmen and handymen. Three viate—plumb, level and 45°. Size 9° x 1½° x 5½°. \$2.95

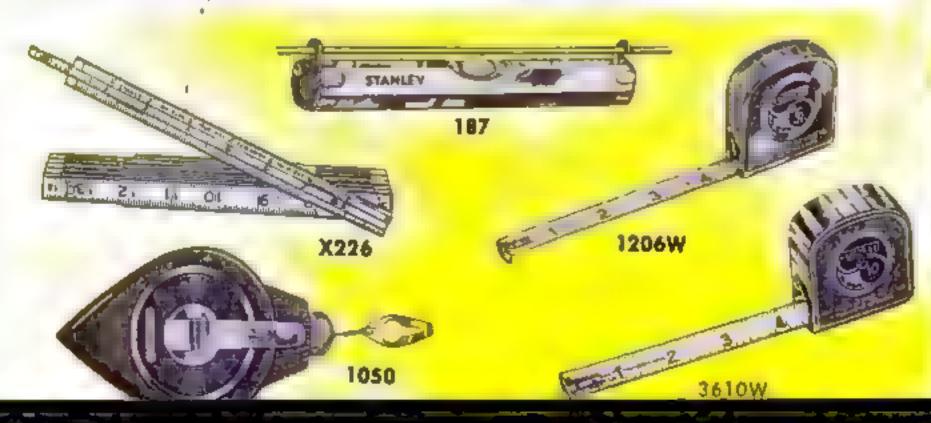

R226 Four-may Extraction Rule. Finest, most versatile rule made. Used as folding rule, marking gauge, slide extension for inside and oxiside measurements. Plastic-costed, easy to read, 5 ft. long. \$2.80

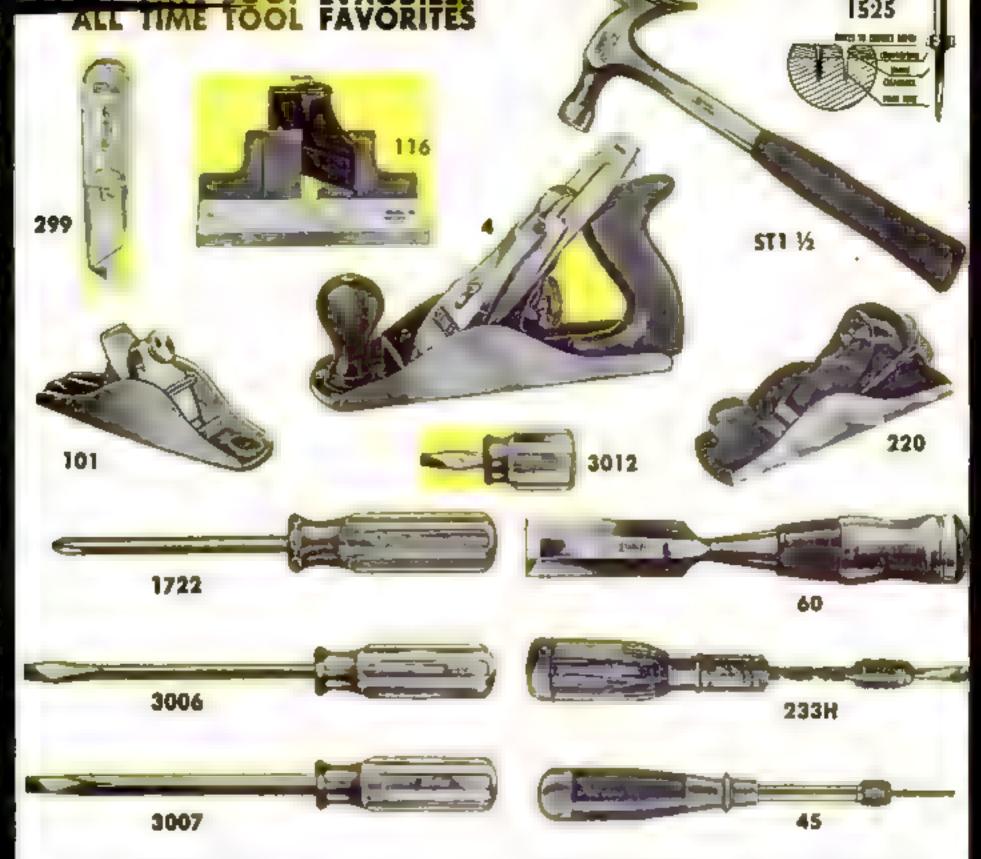

187 Line Level. Clips on line or cord to determine grades for taying pape and brack; trimming hudges, etc. Made of eleminum, 85 c

12060f Tape Bate, 5 ft. long, 1/2" wide, easy to read black merkings on white plastic-costed blade. D-shaped chrome-finished case, \$1.10

3610W Tape Rule. Extra wide ½", extra long 10' tape rule, provides greater rigidity for extended measuring of plywood and hard-to-reach overhead members. White firstly, clear black numbers. D case chrome-plated, \$2,49

1050 Chelk Line Reel. An inexpensive, handy, marking device for construction, garden and play area layouts. Aluminum case, with plumb bob point and universal book for easy operation. \$1.69

299 Utility Kaffe. Cuts wallboard, paper, cardboard, fabrics, linoleum and veneer. 5\%" long. \$2.00

101 Trimming Plane, Handy "one hander," 31/2" long.
1" cutter, ideal tool for tight spot touching up. \$1.25

116 Mitro Best. Well-built, inexpensive, ideal for most home projects. Back, saw guide, and index plate made of heavy pressed steel; board of hard maple. Easy-set saw guide can be locked at any point from 45° to 95°, 36.95

No. 4 Plane. World's most popular, most used plane, 9" long, 2" cutter True, smooth, machined sides and bottom. Handle and knob are genuine resewood. Cutter made from selected tempered steel. \$11.00

3012 Orieer.* Close-quarter 11/4" blade, standard tip. 23/4" over-all. 55e

\$11½ Steelmester Homener. The finest all-steel hammer made! Specially heat treated handle and claws. Face remtempered Handle—chrome alloy. Grip—custom combured neoprene. 16 oz. \$4.99

220 Block Plane, Adjustable cutter. Bottom and sides milled and ground. 7" long, 1%" cutter, \$3.98

1525 "SCREW-MATES." Combination drill/counteraink Does 4 jobs in 1. Works nassly. Cuts screwdriving time in helf 22 popular sizes from ½"x #5 to 2"x #12,75¢ ea

1722 Driver for recessed Phyllips head screws. Great timesever around the car, appliances. Takes Nos. 5 to 9 acrews. 8½" over all, 724

3006 Driver, 4" s 1/4" std. blade & tip. 71/4" over-all 55/4

3007 Driver, $6^{\circ} \times 5/16^{\circ}$ aguers blade with standard tip. $10\frac{1}{2}^{\circ}$ over all. 85e

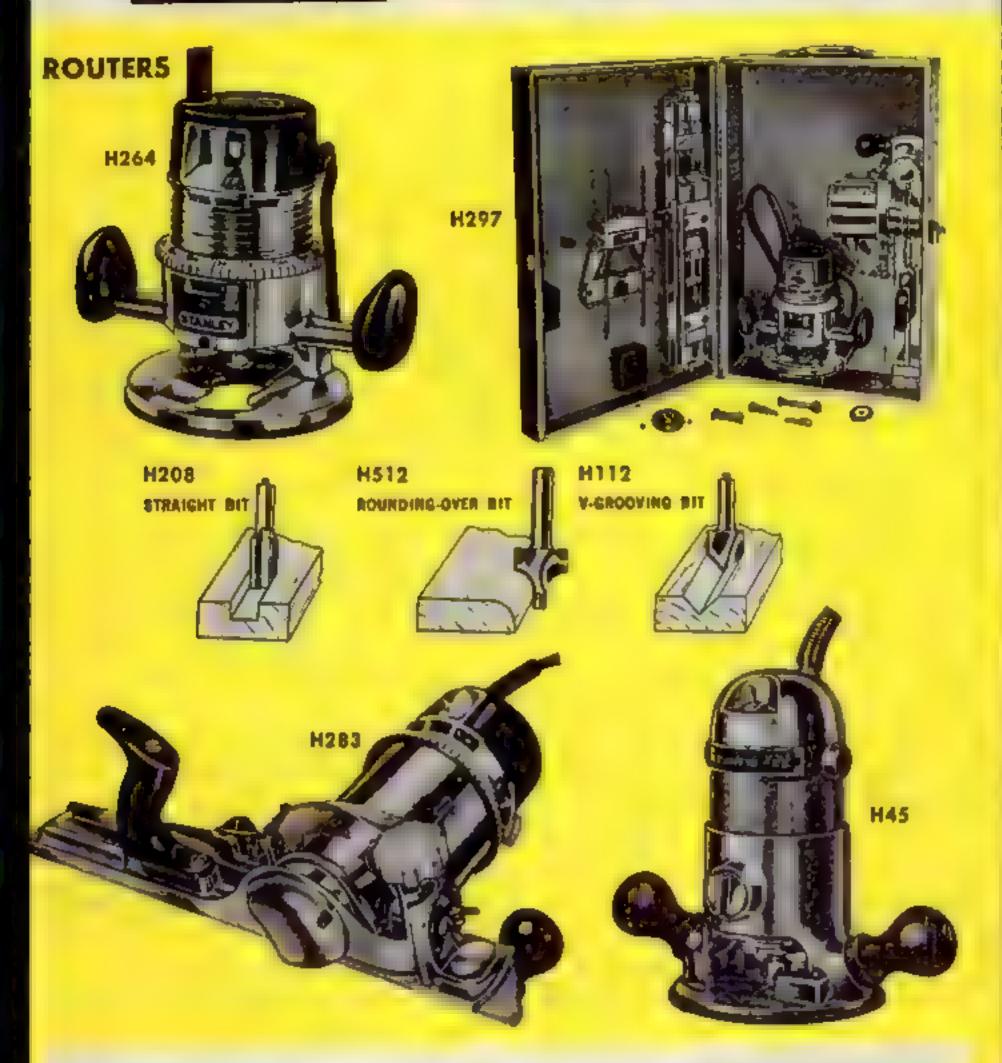

No. 60 Wood Chisele. Then blade, butt-type. 3" long. A real craftsman's tool. Tough steel-capped plastic handles. Forged, tempered and accurate cross ground steel blades. 1/4" to 2" sizes. \$2.60 up.

233H Spiral Ratchet Screwdriver. A push drill as well as a screwdriver. Has plastic magazine handle containing 2 screwdriver bits and 3 drill points, \$4.98

45 Push Drill. Used to make pilot holes for screws and brads—in a jiffy. Plastic handle holds 8 drill points from 1/16" to 11/64", \$5.95

* "Cushion-Core" Handyman Screwdrivers have special red plug set in tough plastic handles. Blades are forged steel with cross-ground tips.

STANLEY ELECTRIC TOOLS

M254 Heavy-duty Region. New Inside and out Makes hundreds of intricate decorative cuts. dedoes, dovetails, mortises Has spotlight. Safety switch locks shaft Bits change with one wrench 1/2 hp. \$62.50

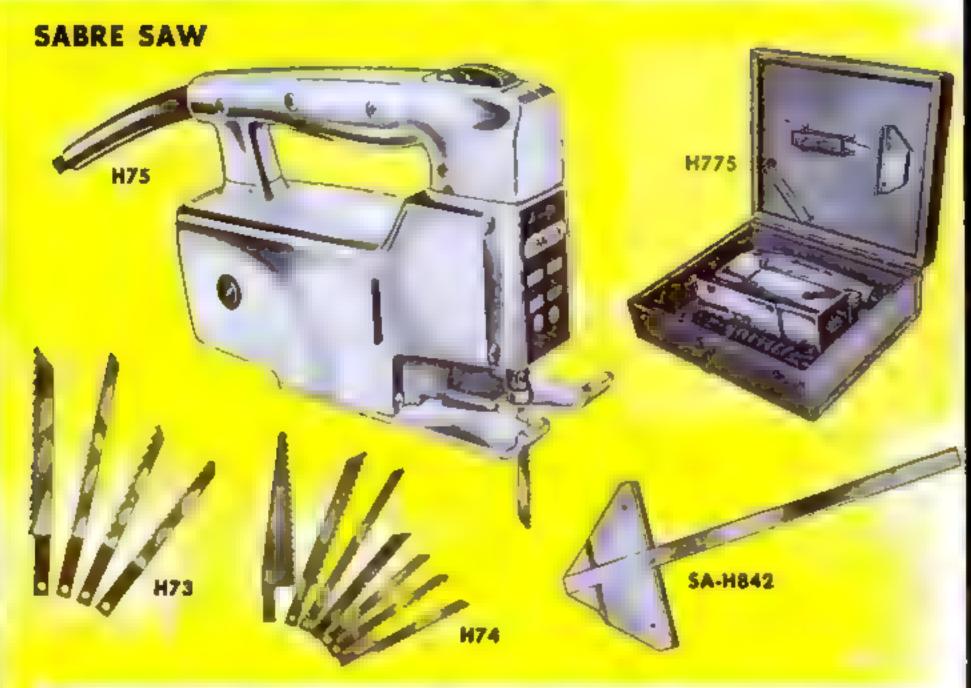

#297 Builders Kit. With new 1/4 hp router, plane attachment, templats, etc.—everything you need for hanging doors to fitting windows. \$166.50

M208 Bit-\$1.70 H512 Bit-\$5.65 H112 Bit-\$3 55 Just 3 of hundreds of Stanley high speed steel router bits

H283 Power Plane. Ideal tool for high-speed planing jobs. Heavy-duty 1/3 hp motor, 16" shoe with filling arbor Cuts 2 1/16" wide, 3/32" deep. \$89.50

H45 Roster. 1/2 hp. rugged yet lightweight—easy to use on vertical work. \$49.50

Built for the professional . . .

N75 Sabre Saw, A powerful professional tool, yet priced lower than any other heavy-duty sabre saw Cuts laminates, plastics, 2" wood—even ½" steel har! Cuts flush to wall, starts own hole, \$54.50 with 3 blades.

H775 Kit. Includes H75 Sebre Saw, & blades, ripping guide, stordy metal case—\$69.95

H73 Sinds Pack. 4 blodes for cutting hard plastics, venuers, laminates—35.25

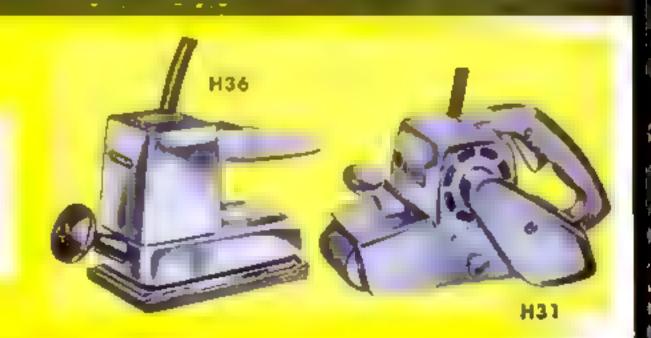

N74 Riede Pack. 7 blades to handle nearly may cutting problem—\$6.95

SA-NB42 Ripping Guide. For streight outs 5" wide; circular cuts 12" dia.—\$1.25

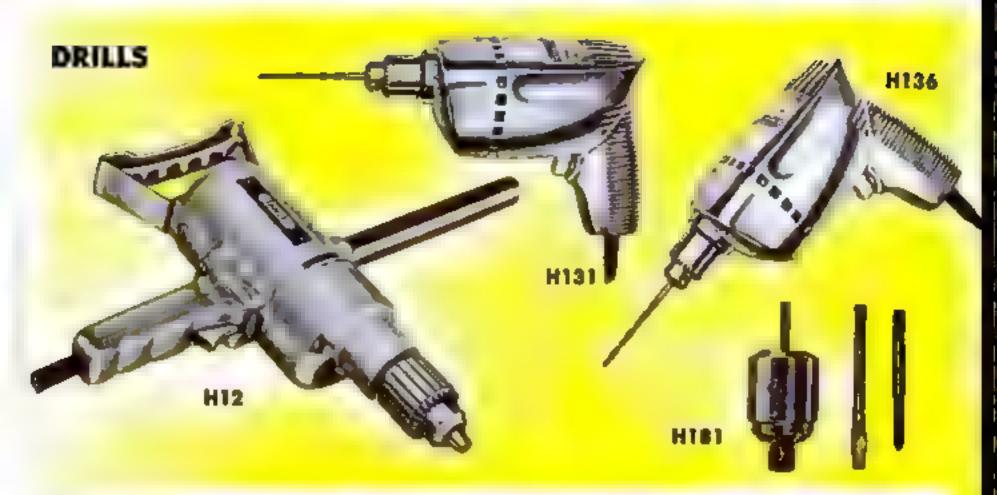

SANDERS

H36 Orbital Sander, Heavy-duty professional tool, Gives furniture, boats, etc. a smooth finish fast. \$54.95

H31 Belt Sonder, Heavy-duty, non-slip belt drive for "hogging down" rough surfaces. Sands wood, metal—even glassi \$89.95

priced for everyone!

H131 1/4" Brill. Full 3.0 amps. Most powerful 1/4" drill you can buy for \$24.95

N136 ½" Drill. Neary-duty, ball-bearing, industrial-rated. Tackles the big jobs with power to space \$39.95 H12 ½" Drill. Tremendous torque, ideal speed for really tough jobs. \$54.50

H181 Screwdriver Attachment. Impact-type. Provides top torque to seat screws fast, easy. \$8.95

NSS6 Power Bit Set, 6 high-speed, moly-tungsten, steelhead bits—1/4" to 1"—in handy plastic bit. \$7.80

H145K "Swirtnung" Seeder Attachment for 1/4" dritte. Woo't mar, scar or run off work. \$4.95

HBO Drill Kit. Includes H131 drill, 28 accessories plus steel case with tray. Perfect for keeping your gest together. \$44.95

H145K

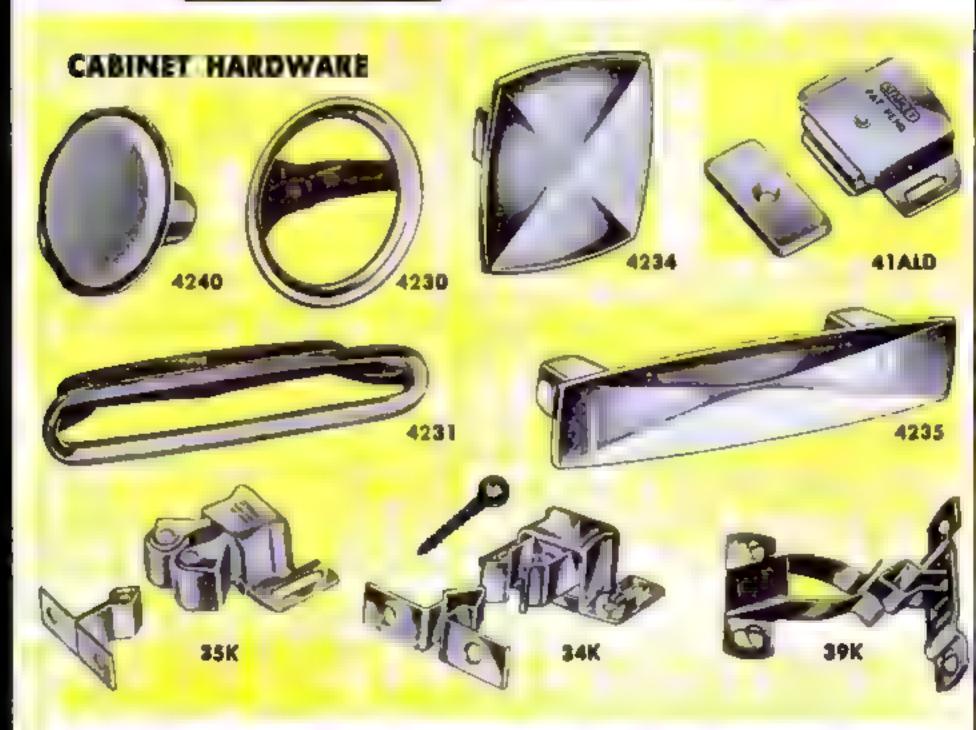

BUILDERS SAWS

H85 Builders Saw. 8", heavy-duty "workhorse" for builders everywhere. \$89.95. One of a whole new line of ultra-high power saws from 6 1/4" to 7".

See Stanley's all new builders saws at your dealer's April 1st!

STANLEY HARDWARE...

4240 Curemic Pulls in pink, blue, juillow add colorful touch to any room. On broaze or silver besee. Popular 1-14" pige 65g co.

4210 and 4231 Fleeting Rings-graceful modern styling in bright, clean chrome or antique copper. 4236-75¢ as. 4231-05¢ on

4234 and 4235 Square Concern Knobe and Pulls with their clean, sheer look are ideal for today's modern kitchens. In chrome or antique copper, 4234 1-1/4 "--- 65e es. 4235--- 85¢ 06.

41ALD Magnetic Cotch closes cabinet doors quietly, tightly. "Floating" magnet edjusts automatically to door warping, 40e as.

bright ideas in beauty and convenience

BI-FOLD HARDWARE

BY-PASS HARDWARE

2980 and 2963 Stanley Bi-field Hardware. Saves space, lets you have full access to rooms or closets. Installs in minutes. Adjusts with turn of a wrench. Doors hang perfectly, work sliently (all contacts by nylon pivots, guides). See Stanley's new 2989 concealed bi-fold hardware for pessageway doors, or 2983 surface-mounted for bi-fold closet doors, at your dealer's. For 4 ft. opening—\$8.00 for the complete set.

2800. Hern's the way to "modernize" storage or closet erass in the house, garage, or cullar—with stiding doors equipped with Stanley's smooth-working by-pess herdware. Track, hangers, floor guide and screws come in one complete package, installed quickly and easily with just a acrewdriver. For 4 fl. opening—\$5.25 per set.

2813 Aluminum Fascia Vrim for by passing doors, stays bright and neet. Strong, easy to attach \$1.65 co.

CORRUGATED FASTENERS

to mand split wood acreen joints, etc.

CONTINUOUS HINGES

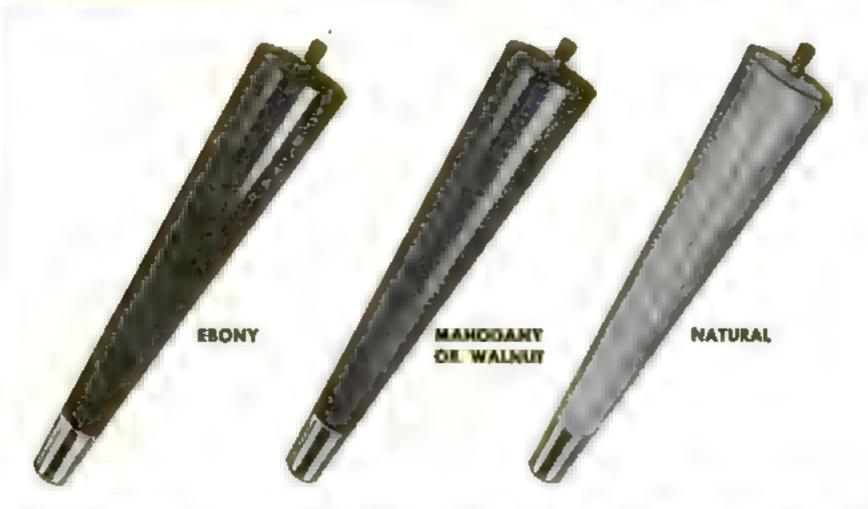

SC-311

Stanley Continuous Minges come in nearly any width and in lengths up to 72". Ideal for boat lockers, hatch covers, fold-away bers, desks, chests, attic hatches, screen doors, etc. In several linishes and metals. SC 311 (shown) in nickel or bress. 1-1/16" x 48" or 1-1/2" x 48"—\$2.76

See your Stanley Dealer for hinges, hasps, barrel bolts, mending plates, strap and T-hinges, screen and storm hangers—and all your hardware needs! 200

STANLEY modern wood furniture legs

Here's a really inexpensive, practical way to make old tables, beds, etc. look like new and to fit any type of new unfinished furniture with attractive stordy legs-Stanley's brand new wood furniture legs, precision-made in smart modern styling with solid brase ferrules and steel gildes.

Available in 4 finishes: Ebony, Mahogeny, Walnut, and Matural (unfinished), and in 8 different lengths from 4 inches to 28 Inches, Perfect for any room decor. Legs screw into a separate, adapter-type steel base plate which can be easily mounted on the bottom of the furniture.

Logs con be fitted to weeden motal bod frames. Provide strong, solid support.

Perfect for modern or contemporarytype chairs. Can be mounted at angles or straight up and down.

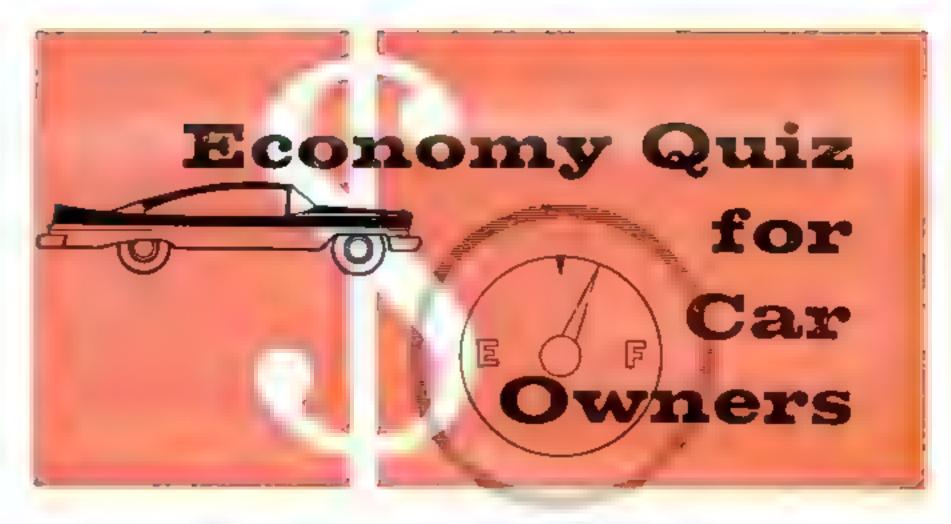

ideal home project: take flush-type door; shape and finish to desired design: At with Stanley wood lags.

TYPE	LENGTH IN INCHES									
	NATURAL	\$2.79	\$2.90	\$3.49	\$3.98	\$4.49	\$4.98	\$5.98	\$6.98	
FINISHED	2'98	3.49	3.98	4.49	4.98	5.98	6.98	7.96		

*Price is for individual sets. Set includes 4 wood legs with fectules and glides; 4 steel base plates; 16 mounting screws.

NOTE: If your dealer does not yet have Stanley's new wood furniture legs in stock, send order to: Stanley-Judd, Div. of The Stanley Works, Wallingford, Conn.

Five of these statements are false. If you

can't spot ti	her	n you'	re wasting money		
One of the simplest ways to drive economically is to develop the habit of accelerating moderately and holding a steady road speed.	THE	FMLSE	7 Running shock absorbers beyond their useful life is poor economy. 8 The use of tune-up oil through the carburetor] [UE FAC	
When approaching a stop sign, or another car from the rear, an economical driver			helps to keep the engine oper- mating at better efficiency.	LUE FAL	, SE
will let up on the gas pedal, allowing the engine to reduce forward speed, instead of driving up close and using the brakes hard to slow the car.	THAT	FALSE	9 Premium-grade gasoline will give better mileage and performance in most automobiles.] [
3 To prevent excessive wear, an engine should be warmed to operating temperature before driving.		PALSE D	10 A new car will give better performance if it is driven slowly during the first 500-m mile break-in period.) [WE FAX	Ţ S
The most efficient way to time an engine is to ad- vance the spark until a slight knock, or ping, can be heard	THEE.	FALSE	Having the car tuned up and the ignition timed at regular intervals will save money by assuring top engine performance and gas mileage.	UE FA] .X
Under acceleration. Rotating the tires periodically will result in longer useful life.	TIPME	H.M.	12 The car should be put in the garage when you are through driving, not left out doors to be put away after the engine has cooled.] [SE FAL	SE.
Inflating tires substantially over the recommended pressures will help cut car-operating expenses.	TIME .	FALSE	To score yourself and se you may be able to econe turn to the following page	omi	_

Knowing the right answers can help you

TRUE. Moderate acceleration and steady driving speeds will save more on gasoline costs and operating expenses than any mileage stretching gadget that you can put on the car. Yet this simple way of getting more out of your gasoline dollar doesn't cost a cent, and can also save a nice amount on other operating expenses.

Steady driving, after you have reached cruising speed, will also pay off in savings. Drive evenly—don't slow down and then jab the throttle to pick up the lost speed. Every time you hit the gas pedal, even with a gentle acceleration, you are causing extra gasoline to be burned.

2 sign let up on the gas at a sufficient distance to allow the engine to slow the car so that only minimum use of the brakes will be needed to stop. On approaching another car from the rear, slow down before you are riding his bumper and have to hit the brakes to keep from colliding

Realized or not, it costs money every time you resort to unnecessary braking to reduce the car's speed. And it will cost you again to build up speed. Learn to think shead. It's just poor driving sense to pay for increased gasoline costs by excessive braking.

214 POPULAR SCIENCE

3 up, the quicker it can protect itself from wear. And one of the best ways to reach operating temperature quickly and safely is to idle the motor for only a short period, and then gently drive the car An idling engine develops little heat and takes longer to reach an efficient temperature than one that is working easily.

A prolonged warmup time can account for a lot of wear in the engine as there is not enough heat to vaporize all of the gas. Some raw gas will reach the cylinder walls where it dilutes part of the oil film, leaving the piston rings free to scrape and wear on the unprotected walls. Long idling periods with slow warmup also cause the choke to stay closed longer. This in turn subjects the engine to an overdose of gasoline. It all adds up in time to shorter ring life, worn cylinder walls and, in general, lowered engine efficiency. So start driving right away-but easily-to bring the engine up to operating temperature quickly

4 FALSE. This method of timing an engine has resulted in many costly repair jobs. Today's cars have better insulated and soundproofed engine compartments, making it very hard to hear slight engine knocking, or pinging

To be safe, do not advance the ignition timing beyond factory specifications. If your car should knock when timed according to specifications, then you are not using fuel of high enough octane. Either use a higher-octane (premium) gasoline or retard the timing a few degrees to work with the lower octane ratings. It is permissible to retard the spark slightly to use lower-grade fuels, but you should not attempt to advance it beyond specifications or you could inadvertently shorten the life of the engine

5 4,000 to 5,000 miles to equalize wear and to obtain best mileage. If one or two tires are found to be wearing faster than the others, it is only common sense to switch these tires to a location where they are subjected to less wear.

To obtain full useful life from the spare tire, it must receive a share of road

travel farther on your driving dollar

mileage, too. Make it earn its keep by using it on the car, and give each of the other tires, in turn, a free ride in the trunk.

There are several ways to rotate tires, but one of the most popular is to move the front wheels straight back to the rear, and then put the right-rear wheel in the trunk as a spare. Put the spare wheel on the left front, and move the left-rear wheel to the right-front position, to finish the job.

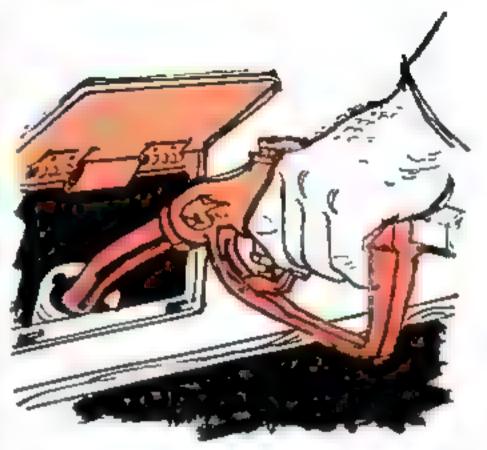

FALSE. Tires that are overinflated may give a small increase in gas mileage, but will suffer increased tread wear. When driven in an overinflated condition, tires begin to show signs of wear faster in the center section of the tread, and if the practice is continued this section will wear smooth while there is still a good amount of tread on each side of the center.

7 TRUE. Shock absorbers wear out and need to be replaced. Useful life for shocks can be as low as 15,000 to 20,000 miles on some cars, depending on road conditions. When shocks fail to control spring movement, the springs are subjected to greater stresses than they were intended to have. Springs bottom and surge, giving a bouncy, ocean-wave ride and leading to early spring failure and rapid tire wear due to wheel bouncing.

To check the shocks, grip a corner of the bumper with your hands and bounce the car up and down. When you let go, the car should return to level with very little rebound. Do this to all four corners to test each shock absorber. If the car bounces much past level after you have let go of the bumper, new shock absorbers are needed.

TRUE. A good tune-up oil will keep valves working freely by loosening the carbon gum on the valve stems. If left to accumulate, the gum can cause the valves to stick and later lead to burned valves and the cost of a valve job.

Tune-up oil also helps to loosen carbonclogged rings so they, in turn, can control oil consumption. When rings become clogged with carbon they are no longer

able to perform their job of wiping excess oil from the cylinder walls, and the engine begins to use oil.

Remove the air cleaner and slowly pour about a pint of upper cylinder tune-up oil through the carburetor while keeping the engine running at a fast idle. Fumes and smoke will be heavy, so do this outdoors. As soon as the can is empty shut off the ignition and let the engine "soak" for about half an hour. Then start the engine and drive the car, preferably on the highway to blow out any loosened deposits.

Grant False. The added expense of premium-grade gasoline for many cars as money wasted. Premium gas will not give any more mileage than the lower priced regular grade unless your car is designed to use the higher-octane fuel. This means that unless you are driving a late-model car, with a high-compression engine, your car does not need—and cannot take advantage of—the highest octane ratings available today.

A few years ago when the majority of cars on the road today were built, you had to use the higher-priced gasoline to keep down engine knock and realize full power from the engine. But as the octane ratings of gasoline have increased, many car owners have found that the new regular grades work as well as the premium fuels that were offered when their cars were new.

Economy driving adds to your car's life, too

FALSE. Don't break it in too gently. If possible, avoid start-stop city driving and take the car out on the highway for the first 500 miles.

After the motor is thoroughly warmed up, drive at 35 m.p.h. for the first halfhour, letting up on the accelerator for a few seconds, about every half-minute. Watch for any signs of overheating. Then speed up to 40 m p.h. and use the up-and down-method of break-in for about another 40 or 50 miles. Once every mile decelerate to 35 m.p.h. and then speed up to 45 m p.h. and right back down to the original 40 m.p.h. This slight deceleration before speeding up will allow extra oil to be drawn to the rings, cooling and lubricating them, and the following acceleration will assist in seating the rings and other moving parts.

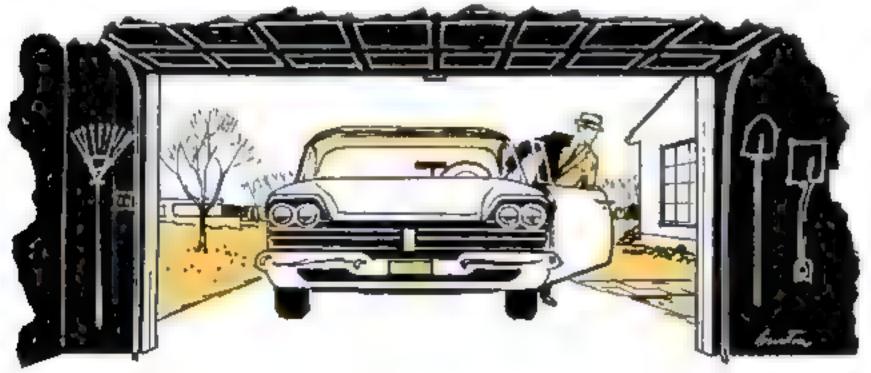

After about 150 miles, you can cruise at 50 m.p.h., but again use the up-anddown treatment for about an hour. Every minute or so coast to 45 m.p.h., accelerate to 60 m.p.h., and then let up to 50 m p.h. After 500 miles, you can drive the car normally except for steady speeds above 65 m.p h. Then all speeds are okay; but maintained high speeds should be avoided until you go beyond 1,500 miles.

TRUE. Periodic tune-ups keep the engine operating efficiently for good gas mileage and top performance. Spark plugs collect carbon and electrodes wear. This means that plugs have to be cleaned and the gap set to specifications to insure proper ignition and power. Breaker points need to be cleaned and adjusted or, if badly burned, must be replaced. Burned and pitted points cause hard starting and lead to early failure of the battery. Points that have worn to an incorrect breaker gap will throw off the engine timing.

Timing should be checked with an ignition timing light after the points have been cleaned, or replaced, and adjusted. Reset the timing to factory specifications if it is not adjusted correctly,

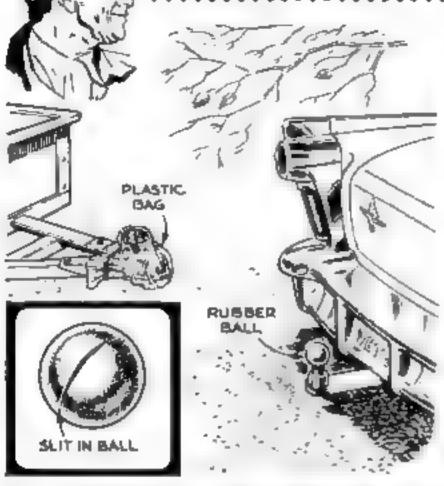

The air cleaner should also be cleaned at this time to insure free passage of clean air to the cylinders. A dirty air cleaner will not filter out harmful dust particles. It also causes an over-rich mixture of gas to reach the combustion chamber, cutting down on gas mileage. Both the admission of dirt-laden air and an over-rich fuel mixture accelerate wear on rings, cylinder walls, and other parts of the power plant.

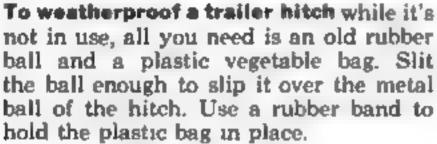

TRUE. Leaving the car out all evening and then driving it into the garage at bedtime is bad business; it can shorten the life of the engine. Much of the wear an engine receives occurs during cold starts and the first few minutes of running. Starting the car, only to run it into the garage, also leaves the cold engine with raw unburned gasoline to drain down the cylinder walls and into the crankcase oil. There it contributes to sludge formation. If left to accumulate for a long period, sludge will lead to an early engine overhaul. Drive into the garage, even though you might use the car again. It may be more bother, but it will save the engine.—Robert V. Thompson.

216 POPULAR SCIENCE

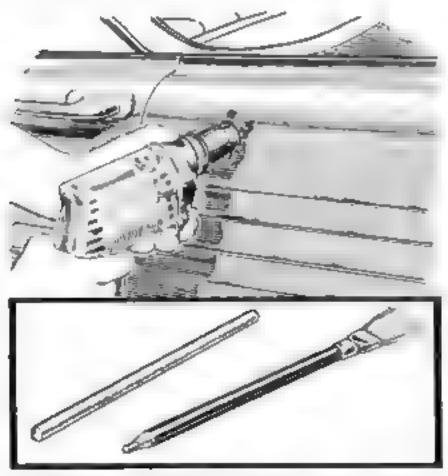

Hints from the Model Garage

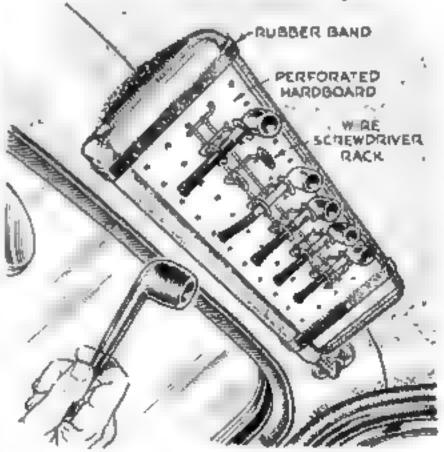

Sudden stops harm new brakes. A new car or one with newly relined brakes should be broken in gently until the linings become burnished Rough use during a break-in period often causes abnormal wear and may cause uneven brake action.

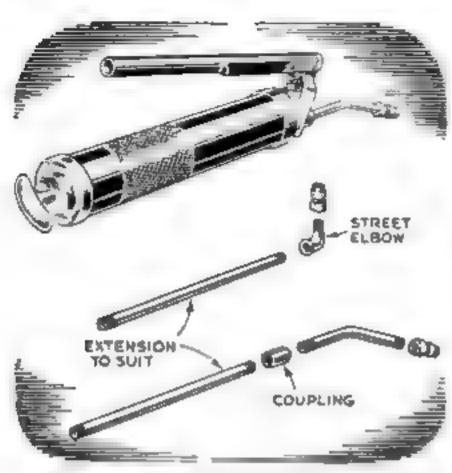

Erasing rust spots is neater and easier than sanding them off. The eraser can be a long pink one made for electric erasing machines or a wood-covered type used by typists. Chuck the eraser in an electric drill, letting 1/4" stick out.

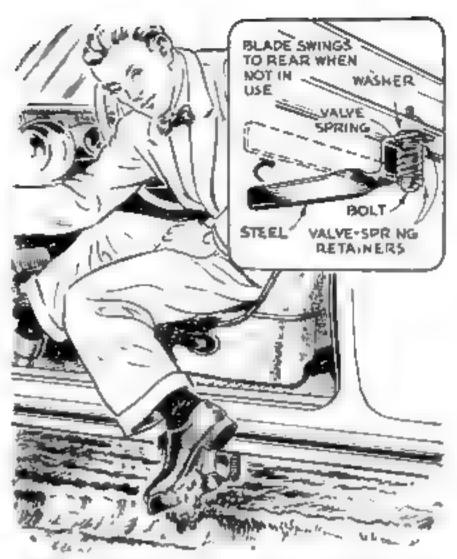

Pipe-smoking drivers can keep a full set of pipes at hand by fastening a simple rack to the sun visor. It's made of perforated hardboard and has wire tool holders to slip the pipes in. Rubber bands are cut from an inner tube.

More Hints from the Model Garage

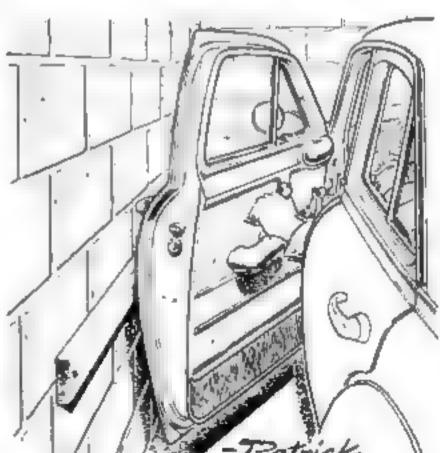

A grease-gun extension of standard pipe (3%" fits most guns) will reach once-in-accessible fittings. About 1½' long, it lets you pump the handle freely, away from grime. The grease gun can be pressed firmly because the extension is rigid.

With a shoe scraper always handy, mud and slush needn't dirty up the inside of a car. This swing-in, swing-out blade bolts to the car frame, and because it's springloaded stays put except when pushed sideways by the user's foot.

installing a wire hose clamp in tight quarters needn't be a knuckle-buster. Before slipping the clamp on the hose, expand it until the ends touch and slip a small washer over them When the hose is in place, pull off the washer.

A bump strip keeps concrete block from scratching a car's paint job when the door is opened inside the garage A 3' length of Celotex, 6" to 12" wide, makes a soft yet durable cushion. Masonry or steel cut nails at both ends hold it.

For the safe, dependable power they must have, most aircraft use Champions. Above, Cessna float plane.

Q. Why do more aircraft the world over use Champions than any other spark plug?

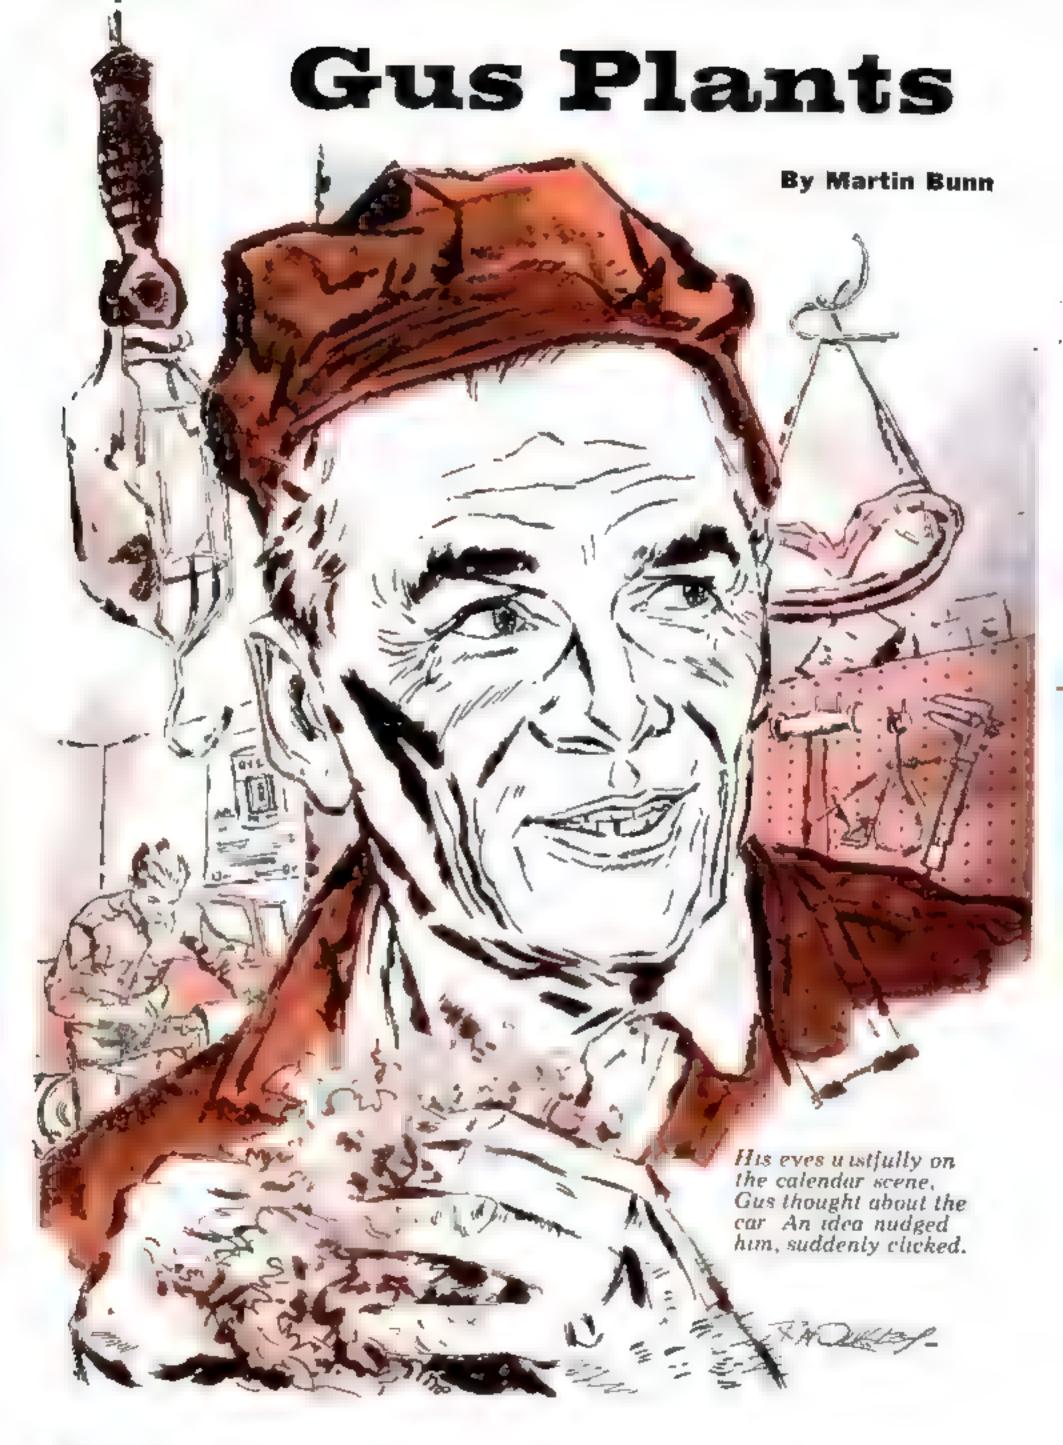

A. In the air, dependable power is vital!

To get that same dependable power in your car, put in new Champions every 10,000 miles. You'll save gasoline, too!

World's favorite spark plug-engineered for every car built by Ford, General Motors, Chrysler, American Motors, Studebaker-Packard and every major foreign maker

CHAMPION

down. Gus Wilson held a rear mainbearing seal in his hand. It was shot. So was his weekend, Gus thought, looking up at a hunting scene on the Model Garage wall calendar. The month read March; the next day's date, Sunday, was circled in red. There was a promise of early spring in the air.

Stan Hicks, his assistant, hung up the telephone. "No luck, boss," he said. "Higgins hasn't got that main seal in stock and he can't get one until Monday."

"There goes my hunting trip," Gus said.

"Why not use your own car?"

"You know the agreement I made with

Sam Barton. If I didn't fix his Lincoln in time we'd call off the hunting and put in Sun, lay fixing up his basement bowling alley."

The phone rang. "Maybe Higgins found that part," Stan said hopefully as Gus took the call. It was Ed McBain

"My garden tractor won't run, Gus, And Hogan's out in his plot making the dirt fly. If you don't come over and fix it he li beat me on the first mess of green peas and I'll never hear the last of it."

"Okay," Gus said, and hung up the phone, grinning. "Hogan and McBain are at it again. Hold the fort, Stan, while I'm off to the battle of the green thumbs."

The phone rang again, This time it

was Hogan's voice in a conspiratorial whisper, "Slip over here with your tool hox, Gus. My tractor's broke down but I don't want old Pig Weed McBain to know it."

Gus winked at Stan. "That's strange. McBain just called and said you were

making the dirt fly."

Hogan cackled over the phone. "He just thinks I am. My motor runs okay and I've got it spitting with the muffler off. But when I throw in the clutch nothing happens."

As HE drove out of town Gus mulled over the situation. He was bound to call on McBain first. But with the backyard garden plots of the two crotchety old rivals separated by only a four-foothigh hedge, Hogan was sure to see him arrive. And with both tractors out of commission, he knew he was heading for fireworks. He wasn't mistaken.

He found McBain, a thin, wiry man, blue of eye and reddish of beard, yanking the starter cord of his tractor. As Gus approached he looked up and snorted, "I'd like to get my hands on the guy who built this contraption. Durned motor won't turn over."

"That's one of the best little motors ever built, Ed." Gus took the starter cord

and gave it a few futile yanks.

"Best, eh?" McBain cocked an ear toward Hogan's yard. "Listen to that, Old Spinach Beard couldn't run a two-bit screwdriver. But his motor runs and mine don't."

Gus removed the gas-tank cap and stuck a finger into the fuel, "As a matter of fact, your motor and Hogan's are identical,"

"Maybe so," McBain said. "I'll wager that old reprobate snuck over here last night and put emery dust in my motor. I'll go over there right now and twist his ..."

"What in time are you doing over there, Gus Wilson?" It was Arch Hogan, his whiskered chin jutting over the top of the dividing hedge.

"Fixing Ed's tractor," Gus said, a twinkle in his eyes. "Wouldn't be anything wrong with yours, now, would there?"

"Course not," Hogan said hastily. "You can hear it running if you're not deaf. I'd better get back to it. My, how things

are growing this spring. Got peas three

inches high already."

"Hogwash!" McBain said. "Peas up three inches! Why, he's just planting them now. Couldn't work the ground until this morning—too wet." The old man took off around the end of the hedgerow, Gus behind him. They came upon Hogan, a silly grin on his face, leaning on the handles of his racketing but motionless tractor.

"By grabby!" roared McBain, "He isn't going anyplace, either,"

"Who told you to come peeking around

my hedge, Pig Weed?"

"Your hedge? The plants you put down didn't grow. Every last plant in that hedge that grew, I planted."

Hogan snorted, "You couldn't grow

wormy radishes."

"Whoa!" Gus cut in. "Neither of you is going to grow radishes or anything else if you don't stop squabbling and let me look at your tractors, McBain's motor seems to be frozen up. Now let me see what's the trouble with this one."

"McBain must have slipped over last night and put metal in my gearbox."

"And who sneaked over last night and put emery dust in my motor?"

"Would have if I'd thought of it,"

Hogan admitted.

Gus, down on his knees, was removing the differential grease-drain plug from Hogan's gearbox. "Guess it'll take about a week to get parts from the factory. Then, let's see, a couple of days to install them. Say about 10 days to get you boys running again."

McBain's rheumy eyes popped. "Ten days! Why, in 10 days it'll be too late to plant peas, that is, peas that'll grow right. Hot weather'll catch them before

they fill, and then . . . "

"And then," Hogan put in, "they'll sort of peter out. They'll make up small and not sweet."

"That's right. Just like those peas you shipped in from the South last year, Hogan, and made believe you'd grown 'em yourself."

"Shipped in from the South!" Hogan took a threatening step forward. "I'll have you know, Pig Weed, that I beat you fair and square last year. I'm of half a mind to . . ."

"Stop it!" Gus stepped between them. "If you two will calm down a minute I'll

show how you both can get your peas in -and today "

"You will?"

"How?"

"Well," Gus explained, "your tractors are identical, McBain has a good chassis and gears, while you, Hogan, have a good motor. Now, if I mount your motor on McBain's rig . . . "

"Not on your life," Hogan protested. "Let Pig Weed rustle up his own motor. Any time I deal with a character who'll aneak around jimmying folks' gears you'll

know it."

"Is that so?" McBain yelled, "And you

can get your own gears. Before I'll deal with a snake in the grass who sneaks over putting emery dust"

"Time out," Gus said, holding up a hand. "I'd say both of you greenthumbed idiots got so excited this morning you forgot something. I'll bet Mc-Bain forgot to mix oil with the gas for his two-cycle motor. And you, Hogan, probably drained your gearbox last fall, just like the factory instruction book

says, and then forgot to put grease back in. Now . . . let me make one good tractor

out of both of these."

Hogan shook his head. "Nothing do-

ing."

"But," McBain said uncertainly, "it might rain, Hogan, and muddy up the ground again. Ten days is a long time."

Hogan pulled at his whiskers, "Come to think of it, Pig Weed, maybe I did drain my gearbox last fall."

"Admit it, do you?" McBain said. "Well now, in that case, maybe I did for-

get to mix oil with my gasoline."

Gus held up two fingers in a V sign. "Well, we won't get anywhere standing here chewing the fat. Let's shift the motor."

"Let's," said McBain.

"Don't mind if we do," agreed Hogan. Driving back to the Model Garage, Gus

chuckled aloud to himself, wondering what McBain and Hogan would say if they knew he could have gotten the parts and installed them in a couple of hours. But getting the two old gamecocks to work together, he figured, was more important.

Gus still had his own problem—Sam Barton's Lincoln with the oil leak that meant no hunting trip. His eyes strayed wistfully to the hunting scene on the wall calendar as he thought about the car. An idea kept nudging him. Then, suddenly, it clicked. "Identical parts," he said aloud

"And what's the name of that ammement park where you work

In the garage office, he thumbed through his parts manual, "Ah, here it is, Stan," he said, running a finger across a page. "The crankshaft rear oil seal of the '57 Lincoln also fits '57 Fords. And that means vice versa. Get it, Stan?"

"Sure, boss, but this is Saturday and

the Ford dealer"

"Never mind the dealer. What's your

"Why, a '57 Ford . . . " Then it dawned on him what Gus meant. "No, not that."

"Yes, that. Get going and switch those identical parts so I can go crow-shooting tomorrow."

Stan was finishing up when Gus came out of the office, a shotgun in each hand. "Here's a gun for you, Stan," he said. "Come along with us."

Next month: Gus challenges an electronic marvel.

TAXI ENGINES RUN 200,000 MILES... AND SO CAN YOURS!

Do as fleet owners do—replace key parts and get like-new pep and power!

Your car engine is not worn out at 40,000 or 50,000 or 60,000 miles. Take a tip from the experts who own and run huge fleets of cars and trucks. Overhaul the engine, replace key parts such as bearings and rings... and get back all the pep and power of a brand-new car!

SYMPTOMS OF BEARING WEAR

Your car will tell you when it needs new engine bearings. Is it alugash or slow; does it mus, knock or ping? Is your gas mileage low; do you need oil again? Are spark plugs fouled with sludgy black oil and carbon? Then it's time for an overhaul—and new Federal-Mogul bearings.

FOR AN "OVERHAUL", BEARINGS

You're wasting money on any overhaul that doesn't include new engine bearings. Parts account for the smaller portion of the cost, so it pays to do the job right the first time. Even new piston rings can't control the 25-times normal oil throw-off from worn engine bearings.

FEDERAL-MOGUL MEANS BEARINGS

Bearings are the heart of your engine. Yet when you need main, con rod or camshaft bearings,

the costs no more to use the best—Federal-Mogul Engine Bearings. Ask your mechanic..., he knows and trusts Federal-Mogul quality!

FEDERAL-MOGUL SERVICE

around their bodies so they can bring 'emup.

Newman himself has proved how wrong Victor Hugo was in labeling the octopus the terror of the deep. Newman turns his into pets. He does it because you can train an octopus, which can learn, and can remember what it learns. For perhaps the most amazing thing science has discovered about the cephalopod is its brain; Connected to a marvelous nervous system, and to eyes as good as, and in structure almost identical with your own, the brain makes the octopus one of

Next Month: Is the "dumb" or reckless driver always to blame for accidents? Not so, says Ed Fales in his eye-opening article on "Stupid Traffic Rules." Foolish laws and confusing signs can turn any law-abiding citizen into a violator. For the full story, don't miss April Popular Science.

the keenest-witted creatures in the sea and certainly the smartest of all animals without backbones.

The high I. Q. of the octopus is what permits Murray Newman to teach his pets to show the public how harmless they are. Describing one of them, Newman writes: "When the octopus sees his keeper above his tank, he blushes with excitement and stretches his arms up toward the surface. The tendril-like tips curl up over the side of the tank and will wrap around a finger as delicately as a baby's hand."

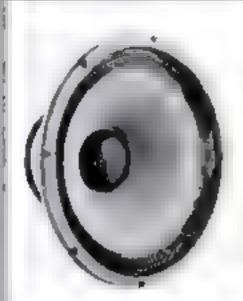

And Cecil Brosseau, of the Point Defiance Aquarium in Tacoma, proves the tameness of the supposedly fierce octopus by having his octopuses take herring from visitors. The visitors include kindergarten children.

Says one naturalist: "They have missed the status of brainy intelligence, of which man is the foremost example, only by a very narrow margin. There is good evidence that at one time the forefathers of the present octopuses very nearly ruled the world. Had they been able to pass the barrier of the edge of the ocean . . . there might have been no limit to the amazing forms which might have peopled the earth."

RW-489 12" SOFT SKIVER WOOFER:

Properly mounted in a Stromberg-Carlson Acoustical Labyrinth quarter wave-length duct enclosure, this woofer produces a flat response to 18 cps, with minimum distortion and excellent transient response, \$49.95.

House Paint that Lasts 50 % Longer [Continued from page 100]

—with an oil-type primer or penetrator required as a first coat under certain conditions. Nobody is arguing the point.

But if you're a slap-dash brush artist, prepare for sober reflection when you read the instruction booklet.

Preparing the surface. The substance of it is this: Luco-Tex takes very careful surface preparation. If wood has previously been painted, you must remove all traces of dirt, stain and chalk, and rough up any glazed areas, before applying Luco-Tex directly. Or, to speed the job, give your house the careful, but less thorough, preparation you would for repainting with oils or alkyds, and then apply Luco-Tex primer before applying the acrylic. On new wood always use a coat of oil primer, first. Directions for conditioning masonry range from simply removing dust from new unpainted bricks to sandblasting off heavy deposits of old cement-type coating

Du Pont is slightly more conservative. While its chemists have plenty of evidence that their acrylic will have very long life when applied over firmly adhering old paint, they want to analyse exposure evidence gathered over the past winter before recommending it for previously coated surfaces.

Meanwhile, Du Pont is plugging its product only for masonry, and for wood that is either new or completely stripped of all previous paint. This limits its sale to a maximum of from 10 to 15 percent of the house-painting market. But there, Du Pont firmly believes, it offers the longest-lived beauty and protection ever bucketed.

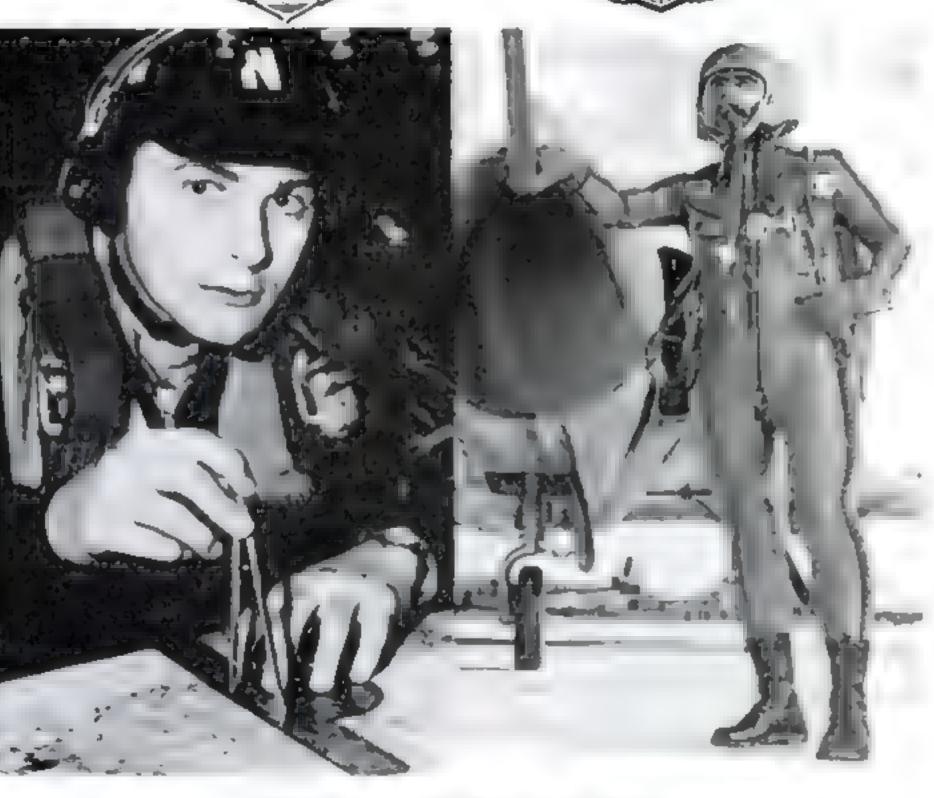

Again, the accent is on a primer (alkyd type) that does two things: First, it prevents bleed-through of natural wood stains (no number of coats of directly applied acrylic can). Second, it forms a sandwich coat between expanding and contracting wood and the tough but more rigid finish coats (this prevents cracking).

So there you have it. Neither manufacturer—or any other reputable one in the acrylic field—wants you to use his product unless you're prepared to apply it as he recommends. There's too great a future in acrylic house paints to have them knocked down by ill-advised or careless application.

THERE'S AN IMPORTANT FUTURE AHEAD FOR THE MEN WHO WEAR THESE

The Air Force pilot or navigator is a man of many talents. He is, first of all, a master of the skies—and no finer exists. In addition, he has a firm background in astro-navigation, electronics, engineering and allied fields. Then, too, he must show outstanding qualities of leadership, initiative and self-reliance. In short, he is a man eminently prepared for an important future in the new Age of Space. Find out today if you can qualify as an Air Force pilot or navigator. Mail the coupon below now.

America's Meanest Little Mountain

[Continued from page 121]

flying over the valley, Beals gave up and went back indoors.

Things have not changed since Sergeant Beals' time. The present weather station on the peak has now been in operation for over 26 years. Its figures show that, on Mount Washington'

• From November to April, there is a wind of hurricane force (75 m.p.h. or above) on the average of at least every

other day.

 In March, there is a hurricane wind two days out of three.

 The average winter wind velocity is about 55 m.p h.

 In the summer, the wind is often four times as high as that of the lowland areas.

Mount Washington attracts wind because it is the highest point anywhere around and because it lies in a cyclone belt. The weather station has often clocked winds approaching 200 m.p.h. The great Boston hurricane of September, 1938, produced only a wind of 87 m.p.h. at its highest, with a pressure of 20 pounds per square foot. A 200-mile wind exerts a pressure of 80 pounds to the square foot of any surface it blows against. The buildings on Mount Washington—a summit hotel, TV and radio installations. and those used by the weather bureau and the military to house men who test survival gear and jet engines—are anchored by great steel bands whose ends are fastened in concrete. Even so, they have rocked like ships in a rough sea—a phenomenon that has been reported time and again on the mountaintop. In that 231m.p.h. wind of April, 1934, their walls warped in and out almost as if they were accordions.

Brad Washburn, after learning mountain climbing on Washington, went on to become a pre-eminent explorer of Alaska Says he: "I've never seen winds in Alaska worse than those on Mount Washington."

The sudden changes. On a clear day, that wind can pick up a fist-size cloud miles away, hustle it over to the mountain at airplane speed, and produce a storm almost instantaneously. Bob Cary, a Dartmouth College junior who is hutmaster at Lakes of the Clouds and has some years' experience in the region, says: "The weather can change in five

America's Meanest Little Mountain

minutes from good to bad, but it never changes back that fast."

The freezing fog. This, said the late Charles F. Brooks, a Mount Washington weather expert who died in 1958, "is one of the most remarkable features of Mount Washington weather. When it is realized that the summit is in the fog more than half the time in winter, and that the temperature is almost invariably below freezing, the importance of the freezing fog can be appreciated." The fog, he explained, is in reality a cloud enveloping the summit. Its liquid is in the form of

tiny, freezing droplets.

Freezing fog caught Phil Labbe, one winter day in 1957, when he was driving a heavy Sno Cat hauling a sled full of TV gear up to the peak. It cut his visibility to five feet. It covered the summit area and the road with ice, and the ice even formed a gentle incline up to and over the guard wall that protects the road's edge from a 1,500-foot drop. There was, in effect, no guard wall at all. A 100m.p.h. wind, with 120-m.p.h gusts, blew Labbe's Sno Cat and sled sideways toward the cliff. Labbe got out of his predicament—but he had to abandon the sled and its expensive equipment,

Combinations of wind and cold. This phenomenon is above all elso what makes Mount Washington's weather so awful. In most of the earth's iceboxes you get one or the other at a time. Weathermen figure temperature and wind together to come up with what they call "cooling units." By this figuring, Mount Washington has more cooling power i.e., it can make you feel colder—than Little America, which, at its lowest temperature, was minus 72—but had no wind On another day, Little America had minus 58 and a 43-m.p.h. wind. Washington, minus 25 with a 98-mile wind, was colder. Similar figuring shows Washington to be colder than Adelie Land, the Antarctic home of the blizzard; than Pike's Peak, which has less wind; than the Northern Great Plains, Labradov or Greenland: and colder than Sonnblick Observatory, Austria, which is 10,170 feet high but which has an average wind velocity of only 16 m.p.h.

Besides the cold, wind, snow and freezing fog of Mount Washington, there is the sheer wetness. If you are not wear-

America's Meanest Little Mountain

ing a waterproof parka or raincoat it soaks your clothes, conducts the cold and wind right into your marrow, shoots down your body temperature, and thereby quickly destroys your strength and will power. It is very much as though you had fallen into the Arctic or Antarctic ocean; without special survivor clothing your life expectancy would be from seven to 30 minutes.

It was this combination of bad weather features that caught the boy and girl last July. Back in 1855, a girl, Lizzie Greene Bourne, succumbed to it; her clothing was drenched, and she died within 300 feet of a house at the summit. It caught and killed William B. Curtis and Allan Ormsbee, trained athletes and experienced climbers, in June, 1900.

Great though the dangers of the mountain are, they can easily be avoided. Besides that pack and winter clothing, there is, says Brad Washburn, one simple thing to remember:

Don't hesitate to turn back.

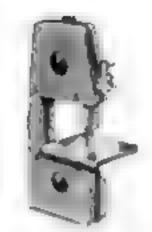

"The one thing," Washburn says, "that has been the outstanding cause of accidents is the lack of appreciation on the part of so many people that it is easier to walk downhill for a mile than uphill for 200 yards under certain conditions—i.e., Mount Washington weather."

When to quit. Washburn says you should turn back as soon as you begin to get cold, or as soon as you feel progressively colder, or as soon as you feel yourself tiring. "With few exceptions, all those who died did so because they struggled to get farther up. They knew there was shelter at the summit.

"But they didn't know that the minute you turn around and walk downhill you start to warm up again. Unless you move fairly fast, you can't warm up. But you do, going downhill. Your arms and legs move fast and get the blood going."

Brad Washburn has three times climbed Mount McKinley, North America's highest, and has been first man up many Alaskan peaks. I asked him if he had ever turned around and started down. "Yes, many times, both in Alaska and on Mount Washington," he said.

Practicing what Washburn both preaches and practices may save your life, and those of people you're with, on Mount Washington.

Revolution in Magnets

[Continued from page 127]

(by an outside magnetic force) stay that way. Electromagnets have domains that fall into and out of alignment easily.

How to make better magnets. The great practical value of the scientists' new knowledge is that how-to-do-it quality.

The iron-powder magneta are one example. The theory said that a very small, long and narrow particle of iron—about 50 atoms (a tenth of a millionth of an inch) wide—would have all its atoms lined up in one single domain. It would be very difficult to demagnetize because of its shape and therefore would make an excellent permanent magnet

No one had ever made such small, carefully shaped bits of iron before. It took Thomas Paine and his associates a couple of years to get the metallurgy right, but the gamble paid off. The process isn't perfect yet—not all the particles are long enough and many of them are knobby.

Electromagnets. The magnets most widely used—in motors, transformers, doorbells—are the electromagnets.

Only one or two percent of the electricity passing through a transformer is wasted in turning magnetic atoms back and forth. Still, you pay for the waste. The loss comes to \$50,000,000 a year.

And that's only transformers. So any improvement is not to be sneezed at.

The latest is magnetic steel with its cube-shaped iron crystals lined up in two directions—like ice cubes in a tray (Westinghouse's brand is Cubex; GE's is Four Square.) Iron atoms line up their magnetism most easily parallel to a crystal edge, so this steel is easy to magnetize in two directions—lengthwise and crosswise. That simplifies the manufacture of electromagnets with odd shapes, and should cut the cost of some types.

Purer steel would help. That's because impurities retard the turning of the iron atoms. But paradoxically, 100-percent-pure iron won't do—its atoms line up with the crystal edges and won't turn.

But what is magnetism? It's a force—one of the few fundamental forces in the universe. The scientists know how to generate it and control it. They can calculate—very, very accurately—its actions. But they can't "explain" it,

Not yet. The day they can, a whole new world will open up.

What kind of a car do you want, exactly? Chevrolet has a choice of nine engines, five transmissions, two suspension systems, regular or Positraction rear axles, special cams, solid or hydraulic valve lifters, two air conditioning systems, even Fuel Injection—the list of extracost options is astonishing. But what it means is that you can virtually design your own car, tailored precisely to your needs. Here's one case in point:

"I 'built' our Chevy as a packhorse"

"My wife always puts down 'profession: housewife' on the income tax forms—but she'd be a lot more accurate if she made it 'bus driver.' We've got a Little Leaguer, a Boy Scout and a daughter in ballet classes, plus a fanatic interest in gardening, and it seems to me she spends 90 per cent of her time transporting kids or plants somewhere.

"So when it came new car time for us I took Chevy's whopping list of options and sat down to 'build' a car that would make her job easier. The nine-passenger wagon, of course, because we have to have the space—and the kids love that rear-facing third seat.

"The budget pointed to that penny-saving Six engine, but Powerglide and power steering were almost necessities—all her driving is stop-and-go neighborhood stuff.

"But I made myself a real hero with something she'd never have thought of—Positraction. She still doesn't know how it works but to hear her talk you'd think I'd invented the wheel—she can cruise right through a foot of snow or the spring mud on that dirt road out to Wolcott's Nursery without a whisper of wheelspin. But I guess I did almost too good a job; that car is hers, and I practically have to pry her fingers off the wheel to borrow it!"

It's a fact; you can make a car yours all the way through with Chevy's terrific spread of options—ait down with the

specs and see what you come up with!... Chevrolet Division of General Motors, Detroit 2, Michigan.

100-Knot Liner to Fly on Sea Wings

[Continued from page 196]

Sea trials, extending through all of 1961, will test this ship under climatic conditions ranging from tropical heat to northern cold where icing effects can be studied. Its travels may take it on runs in the Caribbean, up the Hudson, through the Great Lakes. Success of the exciting trials would open the way to building full-scale hydrofoil liners.

Wanted: a nickname. So novel that they may call for a new name, such as "foilers," the coming winged liners will help close the present gap between the speed of travel by sea and by air.

The fastest envisioned in the Grumman study, a 100-knot liner, will complete its 1,200-nautical-mile coastal run in only 12 hours. Passenger accommodations, for so brief a time, will be more like those of an airliner than a ship. Instead of staterooms, there will be airplane-style seats. As in a plane, probably your seat will have a belt, to be fastened while the ship is getting on and off its wings—and in occasional rough water, just as in bumpy air aloft. At other times you'll go freely about the ship.

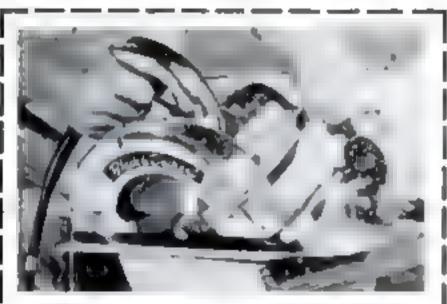

Service à la Pullman. Accommodations on a transatlantic "foiler," which may be fast enough to get you there next day, will be much like those for an overnight trip by rail—individual staterooms, or roomettes; a modest-sized dining room; and a lounge. Such fancy trimmings as ballrooms and swimming pools will be superfluous; and your fare may pleasantly reflect the saving in operating cost.

An aluminum-hulled "foiler" will ride on three submerged wings, of 20- to 31foot span or more, mounted on pivoted hull-supporting struts. To reduce draft in port, where the ship floats conventionally, the titanium-metal struts and foils are retracted above water. An auxiliary engine and propeller dispense with tugs for maneuvering.

Outward bound, foils are lowered and main engines come roaring to life. Through drive shafts within the struts, and bevel gears, power flows to main propellers on the foils. The hull rises from the sea, foilborne and free of the water's drag. A 50-knotter's hull rides 12 feet above the waves; a 100-knotter's, 18 feet, Meanwhile, the winglike foils "fly" under

BLACK & DECKER SAWS ARE PROVED ON AMERICA'S TOUGHEST JOBS!

- CONTROL IN THE WOOD . . . light, balanced, easy to adjust, accurate guide.
- BLADE WON'T QUIT... no clutches or overload gimmicks necessary to protect the powerful B&D-built motor
- SAPETT . . . totally-enclosed, guarded blade; automatic release switch. UL-listed
- Economy . . . fast, accurate cutting produces more and better work
- STRENGTH . . . with new, heat-treated remforced brackets and shoes.

Black & Decker Saws are on the job at America's top 10 construction projects—From the new Air Force Academy to the Cape Canaveral Missile Center.

The same tough dependability, prized on big construction jobs, makes a Black & Decker Saw your best choice—whether you use it on the job or around your home. You'll find it turns out work faster, with far less maintenance and easier handling. Choose from five models—6½" to 9½" blade sizes. Check Black & Decker's Chain Saw attachment, and the Heavy-Duty Saw Table that triples your Saw's usefulness. Ask your B&D dealer for a demonstration next chance you get.

100-Knot Liner to Fly on Sea Wings

water, three to six feet below the surface.

For steering, the whole after-strut, with foil and propeller, swivels like an outboard motor. Or, in an alternate plan, struts have rudder flaps above the foils.

Choice of designs. These specific de-

signs are offered by Grumman:

1. Coastal liner of 100 knots (115 m.p h.): 652 passengers; 500 tons; 251½ feet overall; approx. 60,000 hp. from three gas turbines driving three water propellers; conventional-type hull; range, 1.200 nautical miles.

2. Coastal liner, same as No. 1 except: 600 passengers; 247 ft. overall; seaplane-type hull. (This is the type that the prototype vessel is expected most nearly to resemble—though the prototype will operate at various speeds and ranges, and interchange different foils, to test other designs.)

3. Coastal liner, same as No. 2 except: 51,000 hp. from six gas turbines

driving six air propellers.

4. Tranocean liner of 50 knots (nearly 60 m.p.h.): 150 passengers; 500 tons 251½ ft. overall; 13,500 hp. from three

diesel compound engines (diesels whose exhaust runs gas turbines) driving three water propellers; conventional-type hull; range, 3,600 nautical miles.

5. Atomic-propelled transocean liner of 65 knots (75 m.p.h.): 320 passengers; 1,000 tons; 321½ ft. overall; 52,500 hp., from atomic reactor operating helium-gas turbine that drives single water propeller; reactor hung on extra strut beneath hull, in pod kept submerged 20 feet deep to save weight of heavy shielding; conventional-type hull, with well, into which reactor strut telescopes to reduce draft (after flooding some bottom compartments for extra shielding); range, practically unlimited.

Breaking the speed barrier. The speed of the world's fastest passenger ships has increased by just 10 knots in the past 50 years. Today's best marks—the liner United States' record Atlantic crossing averaging 35.59 knots, and naval vessels' similar top speeds—are believed close to the limit for conventional seagoing ships.

Hydrofoil craft, of which many of moderate size have been built before, long

Johnson announces nationwide motor warranty service!

Every Johnson Sea-Horse is sold with a factory warranty—now more valuable to you than ever before. The new Johnson warranty not only covers all parts of the motor, but it also assures expert installation of warranty-covered parts by any Johnson dealer, anywhere—at no charge to you.

Wherever you go with your Sea-Horse, Johnson service stands behind it. A far-flung network of 4000 certified dealers and 1300 Master Service Stations ready to serve you. Even thousands of miles from home, you are never far from reliable Sea-Horse service—the same kind of conscientious service you'd expect from the dealer who sold you the motor. Johnson pays any Johnson dealer

who gives your motor warranty service.

Remember—when you buy a Sea-Horse, you get an outboard that is built to be dependable. Every Sea-Horse is test-run and adjusted under running conditions before it leaves the factory. And—you get a motor that is serviced to stay dependable. Proof of dependability is the fact that this year Johnson will build its two-millionth motor!

For '59 Johnson leads with the newest and best in outboards: Dynautical Design to go better with your boat—make your boat go better. Sizes range from 3 to 50 hp. Visit your nearby Johnson dealer's All-Family Boat Show—March 6 to 15. Get the inside story from the man who knows outboards best!

North Woods or Florida Keys - dependable Sea-Horse service is everywhere!

100-Knot Liner to Fly on Sea Wings

have offered the promising advantage of escaping the speed-limiting frictional drag of water on a hull.

But only now has come the conquest of the most formidable obstacle to greater

speed—the cavitation barrier.

Cavitation, or low-pressure boiling, occurs when a marine propeller spins too fast. Vapor bubbles, forming in the nearvacuum left by the blades, collapse haphazardly and explosively on the blades' suction surface. Vibration, slip, destructive damage to the propeller result. This also happens to an over-speeding hydrofoil—in fact, a propeller blade is a kind of hydrofoil.

How the problem was solved. The new advance turns cavitation from a handicap into a help. It consists of purposely forming a vapor cavity so large as to envelop the whole suction face of a blade or foil—and then collapse, out of harm's way, well beyond the trailing edge. Because only one side of blade or foil touches water, this "supercavitation" actually reduces drag.

A cunningly calculated hydrofoil profile, typically with a blunt trailing edge, turns this trick. The first of several mathematical formulas yielding such a supercavitating shape was recently discovered by Marshall P. Tulin, of the Office of

Naval Research.

Supercavitating foils and blades, while inefficient at moderate speeds, begin to show spectacular superiority above something like 70 knots. Propeller-tip speeds exceed this critical figure, on ships designed for 50 knots or more. So all the water propellers of the Grumman "foiler" designs are supercavitating; and designs faster than 70 knots have supercavitating hydrofoils. Those are the secrets of the amazing performances they promise.

Passenger ships will not be the only ones to apply the new principle. Its use for fast cargo ships, and for warships,

may also be expected.

First of all to go into practical service may be the 110-foot prototype itself. Its prospective owner, the Maritime Administration, expects at the conclusion of its trials to charter or sell it for commercial operation—possibly as a sightseeing excursion vessel. Its future passengers may be riding a craft that has made maritime history.

Now...choose your vocational training!

Now you can train in a field you pick yourself! Under the Army's new "Choose-it-Yourself" Vocational Training System, you choose your voca-

tional training. . and it's guaranteed before you enlist. Here's your chance to get valuable training and practical experience in work you enjoy!

1. CHOOSE

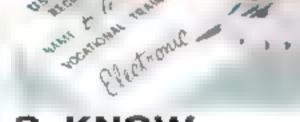

... before entistment?

Choose the vocational training you like from the categories currently available. Your Army recruiter will give you all information and advice you need.

2. QUALIFY

... before entistment!

Take aptitude and physical examinations. To be eligible, you must have a qualifying aptitude score and meet minimum physical requirements for your choice.

3. KNOW

... before enlistmenti

If you qualify, you know you'll get the vocational training you like! Your choice is written into your future Army record—guaranteed before you enlist.

CHOOSE, QUALIFY and KNOW ... WITHOUT OBLIGATION!

Choose from Radar & TV Repair, Electronics, Surveying, Automotive Maintenance, Atomic Weapons, Construction, Military Police, Machine Accounting and many more. Take your choice—without the slightest obligation to enlist. You get the Army vocational training you like—guaranteed in writing—or you don't enlist! This week, get details from your local Army recruiter.

shoots: mild, calm and clear much of the time. There are at least 15 launching pads, including four for Atlas, four being readied for Titan, and others underway for the biggest missile of all, one with 1,500,000-lb. thrust.

Caribbean islands provide a natural series of data-gathering locations along the first portion of the test range, which presently ends at Ascension Island in the South Atlantic, but could be extended easily with radar picket ships. The South Atlantic itself is relatively free of shipping that might be endangered by falling missiles. A ready-made logistics base and air field (Patrick AFB) is 18 miles south, and services the range. Some \$480,000,000 has already been spent in instrumenting the downrange stations for telemetry. And last, but by no means least, engineers and their wives like to live in Cocoa Beach. If the range were located in Alaska, for example, firing down the Aleutian chain, the problems of labor turnover would be prohibitive—even if the weather stayed good, which it wouldn't.

The gloomy side. It isn't all joy and gladness at Cocoa Beach. Despite the million-dollar motels sprouting like glittering mushrooms, the town is struggling with the problems of all forced-draft developments. The area's population has shot from 7,000 to 40,000 since 1950. The schools have four times as many pupils as they had then. Morning and night, when the shift changes for the 18,000 people (five civilians to every military man) who now work at either Patrick AFB or the cape, the causeway to Cocoa Beach is jammed for 12 miles with impenetrable traffic. Good housing is hard to get, even if you are willing to pay the going rate: \$125 a month for a small, twobedroom apartment. Drive-in movies become churches on Sunday. Prices, inevitably, have ridden up on the golden tide of a \$14,000,000-per-month payroll distributed in this tight little area.

There are also some glints of light. Because the community is predominantly populated by top-flight engineers and Air Force people, crime has not been able to get a foothold. Miami hoods tried to get a numbers game going, without success. There is not a single redlight operation in the county. Offspring of the

246 POPULAR SCIENCE

Last Stop Before Space

bulge-brain scientists seem to be running true to form; intelligence tests given in the crammed Cocoa Beach schools revealed that the missile-minded youngsters scored appreciably higher than kids of the same age groups elsewhere.

Smoke on the horison. Old-time Cocoa Beach residents welcome the engineers and Air Force people and their families. They are, however, unhappy about a recent purchase of a hundred acres for a big oil refinery. "We hate to think of looking up and seeing the sky covered with smoke," said Bill Fischer, a Cocoa Beach old-timer, as he and I picked fresh grapefruit off trees in his grove near the proposed refinery site. "We came down here to get away from smoke and fumes. We enjoy the missiles. My wife Helen and I never miss a firing. We have a grandstand seat on our front porch. But missiles are clean. They don't fill the air with smog and fumes."

Port Canaveral, on the ocean just south of the cape, is beginning to handle oceangoing tankers and freighters in a big way. Local boosters predict they will soon be operating one of the most active shipping ports on the East Coast. Taxes in the area support this thesis. One local resident told me that his taxes had jumped from \$95 in 1956 to \$1,900 in 1958. Housing is expanding at a frantic pace. A development for Air Force people is now almost complete just south of Patrick AFB—a thousand of the finest units to be found anywhere in the USAF. Civilian developments are appearing along Route A-1-A south of Patrick, and inland, toward Orlando, to take care of the continuing influx of missile employees.

Thousands of civilians are employed in the huge \$7,000,000 Technical Laboratory, where telemetry data are fed into computers and reduced automatically after every flight. Nor does the activity stop at Cocoa Beach. The Missile Test Center operates 11 air fields, a fleet of ocean-going telemetry ships, 12 camera aites in Florida, and 40 airplanes. As testing moves to the man-in-space phase, the range will, of course, become much more complex. (When a space capsule is down at sea, with a man in it, you hunt with a lot more ships and planes than you'd use in looking for a mouse!)

Nobody hurt, but. Despite the pains-

taking precautions taken to assure range safety, there have been a few narrow escapes. The first Polaris missile that had to be air-destroyed—the one that blew up like a bomb in the Banana River—gave local residents a special designation for the Polaris. Not IRBM—Intermediate Range Ballistic Missile—but IBRM—Into Banana River Missile.

The man who does the worrying for Cocoa Beach—and the downrange islands too—is stocky Lt. Col. Ray Stephens, Range Safety Officer. When a test bird starts to wander off course, Col. Stephens presses a red button on his console, and the straying missile explodes in a flash of fire

"The really critical period is on liftoff," Col. Stephens told me, "With Cocoa
Beach only 15 miles away, there's no
time to fiddle around. If a bird is going
to blow, we want her to do it in the air.
Lox and rocket fuel are explosive on impact. They'd blow a helluva hole in the
real estate if we let 'em."

"Or in the Banana River," I said,

smiling. "Even using solid fuel."

"Yes," Ray Stephens said, also smiling. "The second Polaris didn't do too well, either. It sort of blew up on the pad and started a fire which burned over a lot of the south end of the cape. I heard one report to the effect that 600 rattle-snakes crossed the highway trying to get clear of the flames. Come to check it later, it was 16. Still—that's quite a few snakes."

Everybody's secrets. Most efforts made by the hard-working security people to keep missile shoots a secret are wasted. Everybody in town, a while back, had some private way of knowing the day and hour of a big launch (a dog was supposed to howl in a certain doleful manner, or there's a run on sandwiches and coffee "to go" in a downtown restaurant). Actually, it's so routine now that the news is published, unofficially but with great accuracy, in the local papers. And people who used to sit staring fixedly at the cape for hours now relax until the "rumble" comes. Then you better be fast on your feet, however, or you may be trampled in the rush. When they hear the rumble, everybody in Cocoa Beach—be they downing a drink or diapering the baby—sets aside the business

at hand and breaks for the doors. The big birds go so slowly in the first few seconds that you can catch them quite low.

Now that the biggest missiles, Thor and Atlas, are being airlifted from the West Coast factories to the "skid-strip" on Cape Canaveral, the delivery situation has eased considerably from the days when they were trucked in. Liquid oxygen is manufactured in a large plant on the cape itself, and the dangerous propellants are stored underground in guarded revetments. Strict safety precautions are taken during every step of the program, and serious accidents have been few.

Missiles and wildlife. Though missile launchings until recently have been infrequent, 17 Atlases, 27 Thors, 14 Jupiters, dozens of Snarks, four simulated Polarises and a scattering of smaller-fry rockets have risen, or partly risen, from Cape Canaveral, Still, there is no worry that fish, birds or game will depart from the area. An Atlas engineer was really shaken up not long ago when, upon peering through his periscope from the blockhouse one minute before lift-off, he saw what he thought was a man walk casually over close to the still-quiet ICBM. He was taking in a deep breath to call an emergency hold when the creature moved from behind some scrub growth and he saw it was a deer.

"He wasn't hurt," the Atlas engineer reports, "We looked for him later, and he was gone. One thing we're pretty sure of. That was the most scared deer in the U.S.A. when Baby, out there, let go with all three engines."

Residents of Cocoa Beach have no beefs about the missile activity. It brings them money and excitement with a minimum of headaches. They refer to the cape as Malfunction Junction—but with the fondness of an indulgent parent. They refer to Cocoa Beach, proudly, as a Whoom Town—to differentiate it from old fashioned boom towns. Despite the murderous taxes and the explosive realestate prices, people are still flocking to Cocoa Beach in droves to buy, build and work. As of March, 1959, the whoom in Cocoa Beach is merely beginning its ultimate, hypersonic trip out of this world. END

Last year's profit \$

with a FOLEY AUTOMATIC SAW FILER

"Last year's profit amounted to \$3,000. Not so had for a one-man outfit"—from Chas. C. Hough, James B. Williams wrote us—"I made \$765 last year filing saws, and it sure comes in handy. I do this work in my spare time" Men in communities of all sizes make from \$3 to \$6 an hour with the Foley Saw Filer working full time or part time.

It's no trick to take care of the saw filing for your neighborhood hardware or lumber dealer — plus looking after the saws for farmers, townspeople,

manual training departments and factories. The Foley files all hand saws, also band and cross-cut circular saws. It's a repeat cash business, no canvassing, no eyestrain and no experience needed.

end Coupon for FREE BOOK

SHOWS HOW TO START

"MONEY MAKING FACTS" shows just how you can start at home in your spare time working in your basement or garage, It's an immediate cash business that can develop into a full-time repair shop. Time Payments. Send coupon today—no salesman will call.

FOLEY MFG. COMPANY

319-9 Feley Suilding, Minnespells III, Minnesota Bood me free book "MONEY MARING FACTS" and Time Payment Plan.

Read the truth about why all mufflers wear out... and why SILENTONE LASTS LONGER, SAVES YOU MONEY

It's true that mufflers wear out in many ways. They can blow out, fall off, vibrate apart, or get punctured. But the vast majority of mufflers simply rust away. This is due to acid condensation inside the muffler and the acids eating away at the inner parts and outer shell.

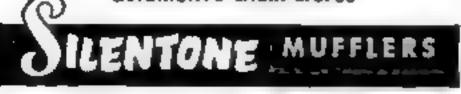

Good internal design minimizes condensation by causing hot exhaust gases to heat all the chambers evenly, eliminating the cold chambers where condensation occurs.

To be additionally sure the muffler you buy will stand up longer, buy a muffler made of heavier steel.

The Silentone double shell has up to 33 % heavier steel than other mufflers use and is zinc coated as well. Outer heads are heavier. too-made of 16 gauge steel, spun-locked into place to eliminate blowouts. Even the inner parts are heavier.

Silentone's rust-resisting construction adds up to a 33% bonus service life and thousands of extra driving miles. Yet this premium muffler will actually cost you less. There's a Silentone designed for every make. and model car. Why not write for free Silentone literature.

> Sold only by America's leading automotive chain stores

Dept. 4C, Toledo 1, Ohio

First aluminum-girder bridge

A HUGE 126-foot girder is placed on concrete piera near Des Moines, Iowa, to form this country's first aluminumgirder bridge. The two-lane span is 222 feet long, crosses two main highways.

On the road: business as usual

THE French Simca Presidence comes with a folding typewriter table on the dash. Set at working height for a portable, it lets an efficient secretary type the boss's letters while riding. The table can be used for snacks and picnics, too.

2263 E VERNON AVE., DEPT. PG -34 LOS ANGELES 58, CAUF

Every Popular Science reader will receive this \$1250 book

who mails the coupon below

Yes, as a joining member of the Outdoor Life Book Club, you will receive the splendid luxury book, Gallery of North American Game, entirely without cost. This newly-printed volume will appeal to you as sportsman, hunter, wildlife enthusiast. It contains thirty-one full-color, full-page paintings of game animals and birds by renowned game artist, Francis Lee Jaques. Each print glows with the natural splendor of pintail duck, mountain lion, greenwing teal, red fox, whitetail deer, canvasback, antelope, caribou, and many others. Here indeed is a gallery of game pictures unique in the outdoor field.

Accompanying these full-color reproductions are field descriptions of the animals and birds written by Ben East, Charles Elliott, P. A. Parsons, Jack O'Connor, Archibald Rutledge and other distinguished wildlife authorities. These detailed and informative essays, filled with practical, how-to hunting facts, perfectly complement the gorgeous paintings.

Gallery of North American Game is handsomely bound in durable linen, stamped in gold. This volume sells for \$12.50 in bookstores, but a limited number of copies has been set aside for sportsmen joining the Outdoor Life Book Club.

Your first selection is a marvelous outdoor reference book!

Yes, The New Way of the Wilderness by Calvin Rutstrum, your first monthly selection, is a wonderful book which includes information on camping methods, equipment, survival techniques, canoe travel, wilderness

recipes, auto camping, hunting and fishing for food and much, much more. Many clearly-drawn diagrams and pictures. The New Way of the Wilderness sells in bookstores for \$4.50; you pay only \$3.25 as a member.

OLBC MEMBERSHIP BUILDS YOUR FAMILY LIBRARY!

After this first big two-book shipment, you'll be offered a book a month from today's best books on hunting, on world-wide exploration, on the marvels of nature, on new fishing techniques, on the animal kingdom — and you need accept only one more selection in the next year to retain all membership benefits.

You'll share in savings resulting from large Club printings by receiving big discounts on every book you accept.

EXTRA—with every future selection you purchase, you'll receive a new and different free surprise gift—a practical item every member of your family will enjoy.

Outdoor Life Book Club, 355 Lexington Avenue, New York 17, N. Y.

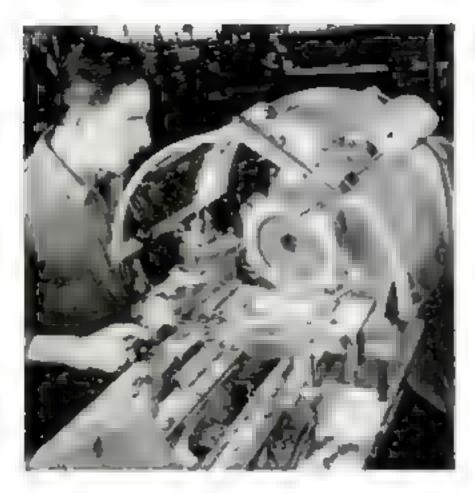

Please enroll me in the Outdoor Life Book Club and send my bonus book. Callery of North American Game and my first monthly selection, The New Way of the Wilderness (combined bookstore price, \$17.00). Bill me later for only \$3.25, plus postage, as payment in full. From the monthly advance descriptions I will receive, I need select only one additional book in the next 12 months. I need pay only Club members' special reduced price and you will include my free gift with each book I purchase.

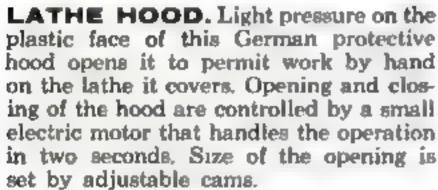

*Avoid post office delay. Include your zone number, if any.

Note to Canadian residents: Membership available in Canada at slightly higher prices. Please mail coupon to: Outdoor Life Book Club, 811 Chatham Street, Montreal 3, Quebec, Canada.

PS-359

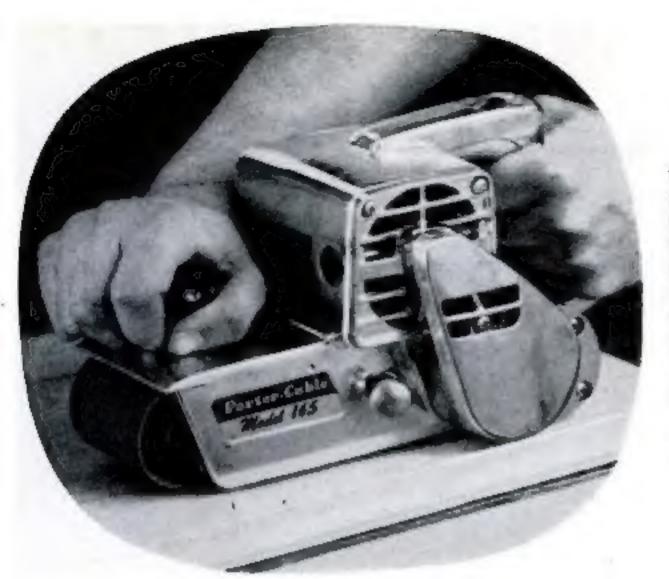

SIDE-WHEELER. Patterned after the old-fashioned steamboats that once plied the Mississippi River, this modern vessel is built completely of plywood. It is propelled by 16 plywood paddles on each of its 8½-foot wheels. An 85-hp engine powers them. Builder and owner is Stanley Hammer of Winona, Minn.

SCOOTER BOX. An ordinary farm mailbox has replaced rear seat and spare tire on the scooter above at right. It carries the textbooks, drawing instruments, lunch and raincoat of Jerry R. Weibel, University of Illinois freshman. When he has a passenger he removes the box and substitutes the conventional extra seat.

NECK VACUUM. Judging from the smile of pleasure on the customer's face, the problem of those itchy hairs that work down the back of the neck during a haircut has been solved. Bernard Passmore, Chicago barber, demonstrates his solution here: a vacuum cleaner for the neck that sucks away the loose hairs.

Porter-Cable BELT SANDER

for fast professional finishes... compact, it weighs only 7½ lbs. and perfectly balanced so that you can use it vertically, horizontally, or overhead with ease. FOR REAL JOB SECURITY -GET AN I.C.S. DIPLOMA

"You can stop worrying, Jane. My job's secure now! And here's the insurance policy to prove itmy I.C.S. diploma!"

This feeling of security is probably typical of every L.C.S. graduate. Because—as the job situation gets tighter, the man with I.C.S. training has the advantage.

Why? Your I.C.S. diploma tells your present employer three important things; (1) You want to make the most of your present job. (2) You have the training you need for advancement. (3) You look for better ways of doing things on your own.

What you do about your future is up to you. Do nothing and stay at your present job at the same old pay. Or earn an I.C.S. diplome in your spare time for security, promotions, more pay! Your first step is to mark the course that interests you in the coupon below, and mail it to us.

Three Free Books

We'll send you three interesting books. The first, "How to Succeed," is a gold mine of helpful tips. Points out many small things in your personality and behavior that can make the difference between success and failure. The second tells about the opportunities in the field of your choice. The third is a sample lesson (Math).

Costs pennies a day

Many an I.C.S. student has made up the cost of his course in one month with the salary increase his I.C.S. training earned for him. By studying at home in your spare time, you pay yourself many times an hour more than you're now making. (One student reports -"My I.C.S. course was worth \$95 an hour to me.")

The security of your present job-or success in finding the new job you've always wanted-is in your hands. Move ahead with L.C.S. training while others stay behind on the routine, small-pay jobs.

Remember, your first step to security is to mail this coupon. Take a few minutes and do it now. If you put it off, it can cost you your future.

OF THE 24 ALBUMS

LISTED IN THE COUPON FOR ONLY

...if you agree to buy five albums from the Club during the next twelve months from at least 100 to be made available

the Book-of-the-Month Club, enables you to have on tap a variety of popular of building such a well-balanced collection. You pay far less for albums this way than if you buy them haphazardly, For example, the introductory offer described here can represent as much as a 40% saving in your first year of membership. Thereafter, through the Club's Record-Dividend Plan, you save almost 331/2% of the manufacturer's nationally advertised price. After buying the five albums called for in this offer, you will

requits new plan, under the direction of receive a free 12-inch 331/2 R.P.M. album, with a nationally advertised price of at least \$3.98, for every two albums purmusic . . . and takes bewilderment out chased from the Club. A wide choice of RCA VICTOR albums will be described each month. One will be singled out as the album-of-the-month, If you want it, you do nothing; it will come to you automatically. If you prefer an alternate-or nothing at all-you can make your wishes known on a simple form always provided. You pay the nationally advertised price-usually \$3.98, at times \$4.98 (plus a small charge for postage and handling).

GLENN MILLER CRCHESTRA IN IN FO

A PURE WHITE FILTER IS ONLY THE BEGINNING OF A WINSTON

It's what's up front that counts!

The big difference is

FILTER-BLEND

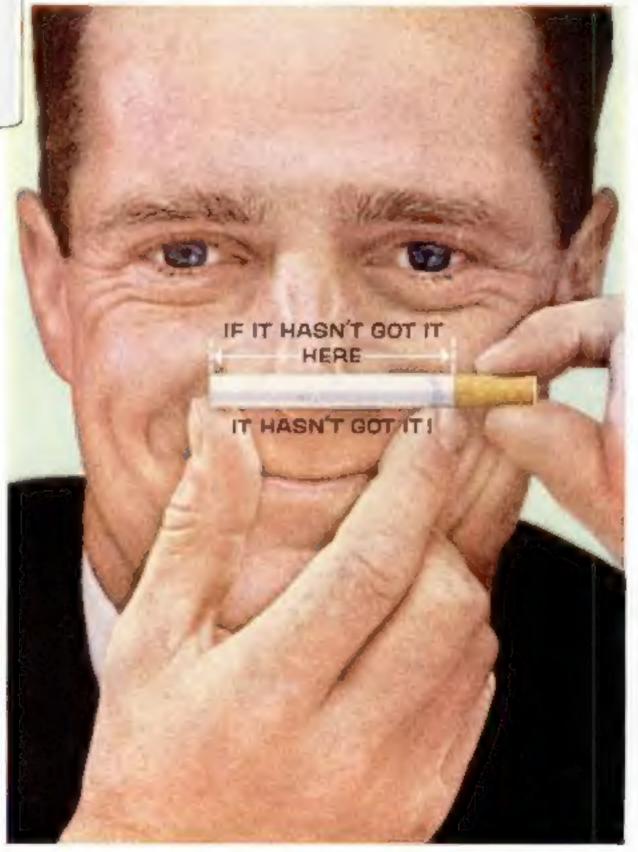

clear, rich tobaccos specially processed for filter smoking!

There's nothing wishy-washy about Winston. For up front of its modern, pure white filter is filter-siend. That's what gives Winston its famous flavor. (And after all, that's the whole idea of smoking!)

mild tobaccos specially processed for filter smoking. It's the real difference between Winston and all other filter cigarettes.

> N. J. RETHOLDS TOBACCO CO., WINSTOR-SALEN, N. C.

Winston tastes good

like a cigarette should!
